**LTE Module Series** 

Version: V1.1

Date: 2022-10-27

#### Notice

Some features of the product and its accessories described herein rely on the software installed, capacities and settings of local network, and therefore may not be activated or may be limited by local network operators or network service providers.

Thus, the descriptions herein may not exactly match the product or its accessories which you purchase. Shanghai Mobiletek Communication Ltd reserves the right to change or modify any information or specifications contained in this manual without prior notice and without any liability.

### Copyright

# 1.Introduction

#### 1.1 Overview

This document introduces the supported AT command set of L50X project.

We don't suggest using proprietary command in a multiple command. There might be abnormal situation occurs.

# 2.V.25ter AT Commands

### 2.1 AT

Return to online command state from online data state

| Execution Command | Response |
|-------------------|----------|
| AT                | OK       |
|                   |          |

### **2.2 ATE**

This setting determines whether or not the TA echoes characters received from TE during command state.

| Execution Command     | Response |
|-----------------------|----------|
| ATE[ <value>]</value> | OK       |
|                       |          |
| Reference             | Note     |
| V.25ter               |          |

Parameters are defined below:

| Parameters      | Description                               |
|-----------------|---|
| <value></value> | 0 Echo mode off                           |
|                 | 1 Echo mode on                            |
|                 | default parameter is 1,so echo mode is on |

### 2.3 ATI

Set result code format mode

| Execution Command | Response            |
|-------------------|---------------------|
| ATI               | <text></text>       |
|                   | OK                  |
| Reference         | Note                |
| text              | Product information |
|                   | Model               |
|                   | Revision            |
|                   | IMEI                |

### 2.4 +++

Switch from Data Mode or PPP Online Mode to Command Mode

| Execution Command | Response  |
|-------------------|---|
| +++               | The +++character sequence causes the TA to cancel the data flow over  |
|                   | the AT interface and switch to Command mode. This allows you to enter |
|                   | AT Command while maintaining the data connection to the remote        |
|                   | server.   |
|                   | OK  |
|                   | To prevent the +++escape sequence from being misinterpreted as data,  |
|                   | it should comply to following sequence:                               |
|                   | 1. No characters entered for T1 time (1 second)                       |
|                   | 2. "+++" characters entered with no characters in between (0.5        |
|                   | second)   |
|                   | 3. No characters entered for T1 timer (0.5 second)                    |
|                   | 4. Switch to Command mode, otherwise go to step 1.                    |
| Peference         | Note  |
|                   | To return from Command mode back to data mode: Enter ATO0             |

### 2.5 ATO

Switch from Data mode/ppp Online to command mode

| Execution Command   | Response |
|---------------------|----------|
| ATO <value></value> | CONNECT  |
|                     |          |
|                     |          |
| Peference           | Note     |
| ATO0                | CONNECT  |

Parameters are defined below:

| Parameters | Description                                     |
|------------|---|
| value      | <b>0</b> Switch from command mode to data mode. |

### 2.6 ATQ

Set result code suppression mode

| Read Command          | Response  |
|-----------------------|---|
| ATQ[ <value>]</value> | <b>OK</b> If value is <b>0</b> .                            |
|                       | (none) If value is 1 (because result codes are suppressed). |
|                       | ERROR For unsupported values (if previous value was Q0).    |
|                       | (none) For unsupported values (if previous value was Q1).   |
|                       | Note  |

#### Example:

| AT Command | Response |
|------------|----------|
| ATQ0       | OK       |
| ATQ1       |          |
| ATQ        | OK       |

#### Parameters are defined below:

| Parameters | Description  |
|------------|--|
| value      | 0 DCE transmits result code                        |
|            | 1 Result codes are suppressed and not transmitted. |

### 2.7 ATS0

This command is used to Set the automatic answering delay

| Execution Command     | Response        |
|-----------------------|-----------------|
| ATS0= <value></value> | OK              |
|                       | or              |
|                       | ERROR           |
| Read Command          | Response        |
| ATS0?                 | <value></value> |
|                       | OK              |
|                       |                 |

#### Parameters are defined below:

| Parameters | Description   |  |
|------------|---|--|
| value      | Enable automatic answering after n seconds.                       |  |
|            | <b>0-255</b> Set Command line termination character to this value |  |
|            | Default value is 0  |  |

### 2.8 ATS3

#### Command line termination character

This S-parameter represents the decimal IA5 value of the character recognized by the DCE from theDTE to terminate an incoming command line. It is also generated by the DCE as part of the

header,trailer, and terminator for result codes and information text, along with the S4 parameter (see the description of the V parameter for usage).

| Execution Command     | Response                |
|-----------------------|-------------------------|
| ATS3= <value></value> | OK                      |
|                       | or                      |
|                       | +CME ERROR: <err></err> |
| Read Command          | Response                |
| ATS3?                 | <value></value>         |
|                       | OK                      |
|                       |                         |

#### Parameters are defined below:

| Parameters | Desc | Description  |  |
|------------|------|--|--|
| value      | 13   | Carriage return character(CR IA5 0/13)               |  |
|            | 0-31 | Set Command line termination character to this value |  |

#### 2.9 ATS4

#### Response formatting character

This S-parameter represents the decimal IA5 value of the character generated by the DCE as part of the header, trailer, and terminator for result codes and information text, along with the S3 parameter (see the description of the V parameter for usage).

| Execution Command ATS4= <value></value> | Response  OK  or  +CME ERROR: <err></err>   |
|---|---|
| Read Command ATS4?                      | Response Value OK or +CME ERROR: <err></err>  |
| Parameters value                        | <ul> <li>Description</li> <li>10 Line feed character(LF,IA50/10)</li> <li>0-31 Set response formatting character to this value</li> </ul> |

#### 2.10 ATS5

Command line editing character.

This S-parameter represents the decimal IA5 value of the character recognized by the DCE as are quest to delete from the command line the immediately preceding character.

| Execution Command     | Response                |
|-----------------------|-------------------------|
| ATS5= <value></value> | ОК                      |
|                       | or                      |
|                       | +CME ERROR: <err></err> |
| Read Command          | Response                |
| ATS5?                 | Value                   |
|                       | ОК                      |
|                       | or                      |
|                       | +CME ERROR: <err></err> |
| Reference             | Note                    |
| V.25ter               |                         |

Parameters are defined below:

| Parameters      | Description   |
|-----------------|---|
| <value></value> | 8 Backspace character(BS,IA50/8)                      |
|                 | 0-31 Set command line editing character to this value |

#### 2.11 ATV

Set DCE response format

| Execution Command     | Response  |
|-----------------------|---|
| ATV[ <value>]</value> | OK or +CME ERROR: <err></err>   |
|                       | - OME ERROR. CITY   |
| Parameter             | Note  |
| <value></value>       | <b>0</b> :Information response: <text><cr><lf>Short result code</lf></cr></text>          |
|                       | format: <numric code=""><cr></cr></numric>  |
|                       | 1:Information response: <cr><lf><text><cr><lf>Long result code</lf></cr></text></lf></cr> |
|                       | format: <cr><lf><verbose code=""><cr><lf></lf></cr></verbose></lf></cr>                   |

#### 2.12 ATX

The setting of this parameter determines whether or not the DCE transmits particular result codes to the DTE. It also controls whether or not the DCE verifies the presence of dial tone when it first goes off-hook to begin dialing, and whether or not engaged tone (busy signal) detection is enabled.

However, this setting has no effect on the operation of the W dial modifier, which always checks fordial tone regardless of this setting, nor on the busy signal detection capability of the W and @dialmodifiers. See Table.

| Execution Command     | Response                |
|-----------------------|-------------------------|
| ATX[ <value>]</value> | OK                      |
|                       | or                      |
|                       | +CME ERROR: <err></err> |

#### Parameters are defined below:

| Parameters      | Description   |
|-----------------|---|
| <value></value> | <ul> <li>CONNECT result code is given upon entering online data state.</li> <li>Dial tone and busy detection are disabled.</li> <li>1CONNECT<text> result code is given uponentering online data state.</text></li> <li>Dial tone and busy detection are disabled.</li> <li>2 CONNECT<text> result code is given uponentering online data state.</text></li> <li>Dial tonedetection is enabled, and busy detection is disabled.</li> <li>3 CONNECT<text> result code is given uponentering online data state.</text></li> <li>Dial tonedetection is disabled, and busy detection is enabled.</li> <li>4CONNECT<text> result code is given uponentering online data state.</text></li> </ul> |
|                 | Dial tone and busydetection are both enabled.   |

### 2.13 ATZ

This command is to Reset default configuration

| Execution Command     | Response                |
|-----------------------|-------------------------|
| ATZ[ <value>]</value> | OK                      |
|                       | or                      |
|                       | +CME ERROR: <err></err> |
| Reference             | Note                    |
| V.25ter               |                         |

### Parameters are defined below:

| configure of the manufacturer. |
|--------------------------------|
| (                              |

### 2.14 AT&F

Set to factory-defined configuration

| Execution Command | Response   |
|-------------------|--|
| AT&F[ <n>]</n>    | OK   |
|                   | or   |
|                   | +CME ERROR: <err></err>                            |
| Parameters        | Description  |
| <n></n>           | 0 Set all parameters to manufacturer default value |
|                   |  |

# **3.General Commands**

### 3.1 AT+CGMI Request Manufacturer Identification

The command causes the phone to return one or more lines of information text< manufacturer > which is intended to permit the user of the ITAE/ETAE to identify the manufacturer of the phone to which it is connected to

| Test Command   | Response               |
|----------------|------------------------|
| AT+CGMI=?      | +CGMI:< manufacturer > |
|                |                        |
|                | OK                     |
| Action Command | Response               |
| AT+CGMI        | +CGMI:< manufacturer>  |
|                | ОК                     |

Parameters and defined below:

| Parameter note                | Description        |
|-------------------------------|--------------------|
| <manufacturer></manufacturer> | Product brand text |

# 3.2 AT+CGMM Request model identification

The command causes the phone to return one or more lines of information text <model> which is intended to permit the user of the ITAE/ETAE to identify the specific model of phone to which it is connected to

| Test Command AT+CGMM=? | Response +CGMM: <module> OK</module>        |
|------------------------|---|
| Action Command AT+CGMM | Response<br>+CGMM: <module><br/>OK</module> |

Parameter are defined below:

| Parameter note |
|----------------|
|----------------|

| <module></module> | Product module id text |
|-------------------|------------------------|
|                   |                        |

## 3.3 AT+CGMR Request revision identification

This command causes the phone to return a string containing information regarding SW version

| Test Command AT+CGMR=? | Response +CGMR: <revision>,<build_time> OK</build_time></revision>   |
|------------------------|--|
| Action Command AT+CGMR | Response +CGMR:" <revision>,<build_time>" OK</build_time></revision> |

Parameters are defined below:

| Parameter note:           | Description       |
|---------------------------|-------------------|
| <revision></revision>     | Product revision  |
| <build_time></build_time> | Compile soft time |

# 3.4 AT+CGSN Request product serial number identification

Returns the IMEI number of the phone

| Test Command   | Response         |
|----------------|------------------|
| AT+CGSN=?      | OK               |
|                |                  |
|                |                  |
| Action Command | Response         |
| AT+CGSN        | " <imei>"</imei> |
|                | OK               |

## 3.5 AT+CIMI Request international mobile subscriber identity

| Test Command AT+CIMI =? | Response <imsi> OK</imsi> |
|-------------------------|---------------------------|
| Action Command AT+CIMI  | Response <imsi> OK</imsi> |

### 3.6 AT+GSN Request TA Serial Number Identification

This command is used to request TA Serial Number Identification(serialNumber)

| Test Command   | Response                          |
|----------------|-----------------------------------|
| AT+GSN=?       | OK                                |
| Action Command | Response                          |
| AT+GSN         | +GSN: <serialnumid></serialnumid> |
|                | OK                                |

# 3.7 AT+MRD\_SN Get TA Serial Number Identification

This command is used to request TA Serial Number Identification(serialNumber)

| Read Command | Response                             |
|--------------|--------------------------------------|
| AT+MRD_SN?   | +MRD_SN: <serialnumid></serialnumid> |
|              | OK                                   |

### 3.8 AT+CSCS Select TE character set

Set command informs TA which character set <chset>is used by the TE. TA is then able to convert character strings correctly between TE and MT character sets..

| Write Command            | Response                |
|--------------------------|-------------------------|
| AT+CSCS= <chset></chset> | ОК                      |
|                          | or                      |
|                          | +CME ERROR: <err></err> |
|                          |                         |
|                          |                         |

| Test Command | Response                                    |
|--------------|---|
| AT+CSCS=?    | +CSCS: (list of supproted <chset>s)</chset> |
|              | ОК  |
|              |   |
|              |   |
|              |   |
| Read Command | Response                                    |
| AT+CSCS?     | +CSCS: <chset></chset>                      |
|              | OK  |

Parameters are defined below:

| Parameters      | Description   |
|-----------------|---|
| <chset></chset> | "GSM"GSM 7 bit default alphabet (3GPP TS 23.038); this setting causes easily software flow control (XON/XOFF) problems. "IRA" international Reference alphabet(ITU-T T.50) "UCS2" 16-bit universal multiple-octet coded character set (ISO/IEC10646 [32]); "HEX"Character strings consist only of hexadecimal numbers from 00 to FF |

### 3.9 AT+GMI Request manufacturer identification

The command causes the phone to return one or more lines of information text< manufacturer > which is intended to permit the user of the ITAE/ETAE to identify the manufacturer of the phone to which it is connected to

| Test Command                  | Response              |
|-------------------------------|-----------------------|
| AT+GMI=?                      | +GMI:< manufacturer > |
|                               | ОК                    |
| Action Command                | Response              |
| AT+GMI                        | +GMI:< manufacturer > |
|                               | ок                    |
| Decemptors are defined below: |                       |

Parameters are defined below:

| Parameter note:               | Description               |
|-------------------------------|---------------------------|
| <manufacturer></manufacturer> | Product manufacturer text |

### 3.10 AT+GMM Request TA model identification

This command requests TA model identification(may equal to +CGMM)

| AT+GMM=?       | +GMM: <module></module> |
|----------------|-------------------------|
|                | ОК                      |
| Action Command | Response                |
| AT+GMM         | +GMM: <module></module> |
|                | OK                      |

## 3.11 AT+GMR Request revision identification

This command request TA revision identification(may equal to +CGMR)

| Test Command   | Response   |
|----------------|--|
| AT+GMR=?       | +GMR: <revision>,<build_time></build_time></revision>                                  |
|                | ОК   |
| Action Command | Response   |
| AT+GMR         | +GMR:"Revision: <version>,build_time: <load compile_time="" file="">"</load></version> |
|                | OK   |

## 3.12 AT+IPR UART BAUD rate setting

Specifies the data rate, in addition to 921600 bits/s or 9600 bits/s, at which the DCE will accept commands. May be used to select operation at rates at which the DCE is not capable of automatically detecting the data rate being used by the DTE.

| Test Command          | Response                                |
|-----------------------|---|
| AT+IPR=?              | +IPR:(list of supported <rate>s)</rate> |
|                       | OK                                      |
| Write Command         | Response                                |
| AT+IPR= <rate></rate> | OK                                      |
|                       |   |
| Read Command          | Response                                |
| AT+IPR?               | +IPR: <rate></rate>                     |
|                       | OK                                      |

#### Parameters are defined below:

| Parameters    | Description   |
|---------------|---|
| <rate></rate> | The rate, in bits per second, at which the DTE-DCE interface should |
|               | operate. Currently, the following rates are supported:              |
|               | 300,1200,4800,9600,14400,19200,28800,38400,                         |
|               | 57600,115200,230400,460800,921600.If unspecified, Default rate is   |
|               | <b>115200</b> bps.  |

### 3.13 AT+CMEE Report Mobile Equipment Error

Set command disables or enables the use of result code +CME ERROR: <err>as an indication of an error relating to the functionality of the MT. When enabled, MT related errors cause +CME ERROR: <err>final result code instead of the regular ERROR final result code. ERROR is returned normally when error is related to syntax, invalid parameters, or TA functionality.

Test command returns values supported as a compound value.

| Write Command AT+CMEE=[ <n>]</n> | Response OK or +CME ERROR: <err></err>          |
|----------------------------------|---|
| Read Command AT+CMEE?            | Response<br>+CMEE: <n><br/>OK</n>               |
| Test Command AT+CMEE=?           | Response +CMEE: (list of supported <n>s) OK</n> |

#### Parameters are defined below:

| Parameters | Description   |
|------------|---|
| <n></n>    | 0 disable +CME ERROR: <err> result code and use ERROR instead 1 enable +CME ERROR: <err> result code and use numeric <err> values (refer next subclause) 2 enable +CME ERROR: <err> result code and use verbose <err> values (refer next subclause)</err></err></err></err></err> |

# 3.14 AT+ICCID Read ICCID of SIM Card

This command is used to read SIM card ICCID if SIM inserted. If SIM not inserted, return +CME ERROR: 10

| Action Command | Response                |
|----------------|-------------------------|
| AT+ICCID       | +ICCID: <iccid></iccid> |
|                | OK                      |
|                | or                      |
|                | +CME ERROR: <err></err> |

Parameters are defined below:

| Parameters      | Description |
|-----------------|-------------|
| <iccid></iccid> | String type |

# **4.Network Service related Commands**

### **4.1 AT+COPS Operator Selection**

Set command forces an attempt to select and register the GSM/UMTS/NB-IOT network operator. If the selected operator is not available, ERROR is returned. Read command returns the current mode, the currently selected operator. Test command returns operator list present in the network

| , ,  |   |
|--|---|
| Test Command   | Response  |
| AT+COPS=?  | +COPS: list of supported ( <mode>,<format>s,<oper>),[<long< td=""></long<></oper></format></mode> |
|  | alphanumeric <oper>,short alphanumeric <oper>,numeric</oper></oper>                               |
|  | <pre><oper>]</oper></pre>   |
|  | OK  |
|  | or  |
|  | +CME ERROR: <err></err>   |
| Write Command  | Response  |
| AT+COPS= <mode>[,<fo< td=""><td>OK</td></fo<></mode> | OK  |
| rmat>, <oper>[,<act>]]</act></oper>                  | or  |
|  | +CME ERROR: <err></err>   |
| Read Command   | Response  |
| AT+COPS?   | +COPS: <mode>[,<format>,<oper>,<act>]</act></oper></format></mode>                                |
|  | OK  |
|  | or  |
|  | +CME ERROR: <err></err>   |

| Reference | Note  |
|-----------|---|
|           | +COPS? response is not alphanumeric format when setting with          |
|           | alphanumeric format   |
|           | example:  |
|           | +COPS: 0,0," KG Telecom Co."  |
|           | If you got +COPS: 0,0,"46688"   |
|           | This is possibly due to there is no alphanumeric format name mapping  |
|           | to the operator id  |
|           | You can define operator name table in the following file under custom |
|           | folder.   |
|           | mcu\custom\common\customer_operator_name.c                            |
|           | Please check if there is operator name mapping in the name table.     |
|           | If not , Please add your operator name and operator id                |
|           | There is comment information in the file to guide you .               |
|           | Please read the guide before modification.                            |
|           |   |

### Parameter are defined below:

| Parameters        | Description   |
|-------------------|---|
| <mode></mode>     | <ul> <li>0 automatic (<oper> field is ignored)</oper></li> <li>1 manual (<oper> field shall be present)</oper></li> <li>2 deregister from network</li> <li>3 set only <format> (for read command +COPS?), do not attemptregistration/deregistration</format></li> <li>4 manual/automatic (<oper> field shall be present); if manual selectionfails, automatic mode (<mode>=0) is entered</mode></oper></li> </ul> |
| <format></format> | <ul><li>long format alphanumeric <oper></oper></li><li>short format alphanumeric <oper></oper></li><li>numeric <oper></oper></li></ul>  |
| <oper></oper>     | string type   |
| <stat></stat>     | <ul><li>0 unknown</li><li>1 available</li><li>2 current</li><li>3 forbidden</li></ul>   |

| <act></act> | 0 | GSM               |
|-------------|---|-------------------|
|             | 1 | GSM_COMPACT       |
|             | 2 | UTRAN             |
|             | 3 | GSM_EGPRS         |
|             | 4 | UTRAN_HSDPA       |
|             | 5 | UTRAN_HSUPA       |
|             | 6 | UTRAN_HSDPA_HSUPA |
|             | 7 | EUTRAN            |
|             | 8 | ECGSM             |

## **4.2 AT+CREG Network Registration**

This command be used to query the register status

| Test Command AT+CREG=?         | Response +CREG: list of supported ( <n>s) OK or +CME ERROR: <err></err></n>                             |
|--------------------------------|---|
| Write Command AT+CREG= <n></n> | Response OK or +CME ERROR: <err></err>  |
| Read Command AT+CREG?          | Response +CREG: <n>,<stat>[,<lac>,<ci>,<act>] OK or +CME ERROR: <err></err></act></ci></lac></stat></n> |

### Parameters are defined below:

| Parameters | Description  |
|------------|--|
| <n></n>    | disable network registration unsolicited result code  neable network registration unsolicited result code+CREG: <stat>  network registration and location information unsolicited result code+CREG:<stat>[,<lac>,<ci>]  anable network registration, location information and cause value information unsolicited result code  +CREG: <stat>[,[<lac>],[<ci>],[<act>][,<cause_type>,<reject_cause]]< th=""></reject_cause]]<></cause_type></act></ci></lac></stat></ci></lac></stat></stat> |

| <stat></stat> | <ul> <li>not registered,MT is not currently searching a new operator to register to</li> <li>registered,home work</li> </ul> |
|---------------|--|
|               | 2 not registered, but MT is currently searching a new operator to<br>register to   |
|               | 3 registration denied  |
|               | 4 unkown   |
|               | 5 registered,romaing   |
|               | 6registered for "SMS only", home network (applicable only when   |
|               | <act> indicates E-UTRAN)</act>   |
|               | 7 registered for "SMS only", roaming (applicable only when <act></act>   |
|               | indicates E-UTRAN)   |
|               | 8attached for emergency bearer services only (see NOTE 2) (not applicable)   |
|               | 9 registered for "CSFB not preferred", home network (applicable  |
|               | only when <act> indicates E-UTRAN)</act>   |
|               | 10registered for "CSFB not preferred", roaming (applicable only  |
|               | when <act> indicates E-UTRAN)</act>  |
|               | 11only emergency services are available.   |
|               | <lac>: string type; two byte location area code in hexadecimal format</lac>  |
|               | 12registeration denied in roaming  |
|               | 13 sync done in LTE roaming network  |
|               | 14 ecall inactive  |
| <lac></lac>   | String type,two byte location area code  |
| <ci></ci>     | string type,two byte cell ID in hexadecimal format   |
| <act></act>   | 0: GSM   |
|               | 1: GSM Compact   |
|               | 2: UTRAN   |
|               | 3: GSM w/EGPRS   |
|               | 4: UTRAN w/HSDPA   |
|               | 5: UTRAN w/HSUPA   |
|               | 6: UTRAN w/HSDPA and HSUPA   |
|               | 7: E-UTRAN<br>8: UTRAN w/HSPA+   |
|               | 9: E-UTRAN CA  |
|               | a. L-O ITAN OA   |

## 4.3 AT+CLCK Facility Lock

Execute command is used to lock, unlock or interrogate a ME or a network facility <fac>

| Write Command  | Response   |
|--|--|
| AT+CLCK= <fac>,<mode< th=""><th>+CME ERROR: <err></err></th></mode<></fac> | +CME ERROR: <err></err>  |
| >[, <passwd>,<class>]]</class></passwd>                                    | when <mode>=2 and command successful:</mode>                   |
|  | +CLCK: <status>[,<class1></class1></status>                    |
|  | [ <cr><lf>+CLCK: <status>,<class2></class2></status></lf></cr> |
|  | []]  |
|  | ОК   |
|  | or   |
|  | +CME ERROR: <err></err>  |
| Test Command   | Response   |
| AT+CLCK=?  | +CLCK: (list of supported <fac>s)</fac>                        |
|  | OK   |
|  | or   |
|  | +CME ERROR: <err></err>  |

### Parameters are defined below:

| Parameters        | Description  |
|-------------------|--|
| <fac></fac>       | "CS","PS","PF","SC","AO","OX","OI","AI","IR","NT","NM","NS","NA" "AB","AG","AC","FD","PN","PU","PP","PC"   |
| <mode></mode>     | <ul><li>0 unlock</li><li>1 lock</li><li>2 query status (only "SC"support query mode)</li></ul>   |
| <status></status> | 0 not active   |
| <passwd></passwd> | 1 active string type   |
| <classx></classx> | is a sum of integers each representing a class of information (default 7)  1 voice (telephony)  2 data (refers to all bearer services)  4 fax (facsimile services)  8 short message service  16 data circuit sync  32 data circuit async  64 dedicated packet access  128 dedicated PAD access |

The <fac>"AB", "AG" and "AC" are applicable only for <mode>=0

## 4.4 AT+CPWD Change Password

Action command sets a new password for the facility lock function defined by command Facility Lock +CLCK.

| Write Command   | Response                                |
|---|---|
| AT+CPWD= <fac>,<oldp< td=""><td>OK</td></oldp<></fac> | OK                                      |
| wd>, <newpwd></newpwd>                                | or                                      |
|   | +CME ERROR: <err></err>                 |
| Test Command  | Response                                |
| AT+CPWD=?   | +CPWD: list of supported                |
|   | ( <fac>,<pwdlength>)s</pwdlength></fac> |
|   | OK                                      |
|   | or                                      |
|   | +CME ERROR: <err></err>                 |

#### Parameters are defined below:

| Parameters              | Description   |
|-------------------------|---|
| <fac></fac>             | "SC" SIM (lock SIM/UICC card) (SIM/UICC asks password in MT power-up and when this lock command issued) Correspond to PIN1 code.  "P2" SIM PIN2 |
| <oldpwd></oldpwd>       | String type   |
| <newpwd></newpwd>       | String type   |
| <pwdlength></pwdlength> | integer type maximum length of the password for the facility  |

## 4.5 AT+CPOL Preferred operator list

This command is used to edit the SIM preferred list of networks. Execute command writes an entry in the SIM list of preferred operators (EFPLMNsel). If <index> is given but <oper> is left out, entry is deleted. If <oper> is given but <index> is left out, <oper> is put in the next free location. If only <format> is given, the format of the <oper> in the read command is changed.

| Test Command AT+CPOL=?   | Response +CPOL: (list of supported <index>s), (list of supported <format>s) OK or +CME ERROR: <err></err></format></index> |
|--|--|
| Execution Command  | Response   |
| AT+CPOL= <index>[,<fo< td=""><td>ОК</td></fo<></index>                         | ОК   |
| rmat>[, <oper>[<gsm_a< td=""><td>or</td></gsm_a<></oper>                       | or   |
| cT>, <gsm_compact_ac< td=""><td>+CME ERROR: <err></err></td></gsm_compact_ac<> | +CME ERROR: <err></err>  |
| T>, <utran_act>]]]</utran_act>   |  |

| Read Command | Response  |
|--------------|---|
| AT+CPOL?     | +CPOL:  |
|              | <index1>,<format>,<oper1>[,<gsm_act1>,</gsm_act1></oper1></format></index1> |
|              | <gsm_compact_act1>,<utran_act1>]</utran_act1></gsm_compact_act1>            |
|              | [ <cr><lf>+CPOL:</lf></cr>  |
|              | <index2>,<format>,<oper2>[,<gsm_act2>,</gsm_act2></oper2></format></index2> |
|              | <gsm_compact_act2>,<utran_act2>]</utran_act2></gsm_compact_act2>            |
|              | []]   |
|              | OK  |
|              | or  |
|              | +CME ERROR: <err></err>   |

### Parameter are defined below:

| Parameters                            | Description  |
|---------------------------------------|--|
| <indexn></indexn>                     | the order number of operator in the SIM/USIM preferred operator list   |
| <format></format>                     | <ul><li>0 long format alphanumeric <oper></oper></li><li>1 short format alphanumeric <oper></oper></li><li>2 numeric <oper></oper></li></ul> |
| <opern></opern>                       | string type; <format> indicates if the format is alphanumeric or numeric (see +COPS)</format>  |
| <gsm_actn></gsm_actn>                 | <ul><li>0 access technology not selected</li><li>1 access technology selected</li></ul>  |
| <gsm_compact_actn></gsm_compact_actn> | <ul><li>0 access technology not selected</li><li>1 access technology selected</li></ul>  |
| <utran_act></utran_act>               | <ul><li>0 access technology not selected</li><li>1 access technology selected</li></ul>  |
| Reference                             | Note: when adding preferred operater, <format> can only be 2</format>  |

### Example:

| AT Commands         | Response  |
|---------------------|---|
| AT+CPOL=?           | +CPOL: (1-8),(0,1,2) <b>OK</b>  |
| AT+CPOL?            | +CPOL: 1,2,"46000" <b>OK</b>  |
| AT+CPOL=2,2,"46001" | OK <note:>Add a preferred operator  If perator is full, then report ERROR</note:> |
| AT+CPOL?            | +CPOL: 1,2,"46000"<br>+CPOL: 2,2,"46001"<br><b>OK</b>                             |

### 4.6 AT+CEREG EPS network registration status

The set command controls the presentation of an unsolicited result code +CEREG: <stat> when <n>=1 and there is a change in the MT's EPS network registration status in E-UTRAN, or unsolicited result code +CEREG: <stat>[,[<tac>],[<ci>],[<AcT>]] when <n>=2 and there is a change of the network cell in E-UTRAN. The parameters <AcT>, <tac> and <ci> are provided only if available. The value <n>=3 further extends the unsolicited result code with [,<cause\_type>,<reject\_cause>], when available, when the value of <stat>changes. If the UE wants to apply PSM for reducing its power consumption, see +CPSMS command and 3GPP TS 23.682 [149], the set command controls the presentation of an unsolicited result code +CEREG:

<stat>[,[<tac>],[<ci>],[<AcT>][,[<cause\_type>],[<reject\_cause>][,[<Active-Time>],[<Periodic-TAU>]]]].
When <n>=4 the unsolicited result code will provide the UE with additional information for the Active
Time value and the extended periodic TAU value if there is a change of the network cell in E-UTRAN.
The value <n>=5 further enhances the unsolicited result code with <cause\_type> and <reject\_cause>
when the value of <stat> changes. The parameters <AcT>, <tac>, <ci>, <cause\_type>,
<reject\_cause>, <Active-Time> and <Periodic-TAU> are provided only if available.Refer subclause
9.2 for possible <err> values.

NOTE 1: If the EPS MT in GERAN/UTRAN/E-UTRAN also supports circuit mode services and/or GPRS services, the +CREG command and +CREG: result codes apply to the registration status and location information for those services.

The read command returns the status of result code presentation and an integer <stat> which shows whether the network has currently indicated the registration of the MT. Location information elements <tac>, <ci> and <AcT>, if available, are returned only when <n>=2 and MT is registered in the network. The parameters [,<cause\_type>,<reject\_cause>], if available, are returned when <n>=3. Test command returns values supported as a compound value.

| Write Command     | Response                |
|-------------------|-------------------------|
| AT+CEREG= <n></n> | ОК                      |
|                   | or                      |
|                   | +CME ERROR: <err></err> |
|                   |                         |

| Test Command AT+CEREG=? | Response +CEREG: (list of supported <n>s) OK</n>  |
|-------------------------|---|
| Read Command AT+CEREG?  | Response when <n>=0, 1, 2 or 3 and command successful: +CEREG: <n>,<stat>[,[<tac>], [<ci>],[<act>[,<cause_type>, <reject_cause>]]] OK</reject_cause></cause_type></act></ci></tac></stat></n></n> |

### Parameter are defined below:

| Parameters    | Description   |
|---------------|---|
| <n></n>       | integer type  0 disable network registration unsolicited result code  1 enable network registration unsolicited result code +CEREG: <stat>  2 enable network registration and location information unsolicited result code +CEREG:  <stat>[,[<tac>],[<ci>],[<act>]]  3 enable network registration, location information and EMM cause value information unsolicited result code +CEREG:</act></ci></tac></stat></stat>   |
| <stat></stat> | <pre><stat>[,[<tac>],[<ci>],[<act>][,<cause_type>,<reject_cause>]] integer type; indicates the EPS registration status 0 not registered, MT is not currently searching an operator to register to 1 registered, home network 2 not registered, but MT is currently trying to attach or searching an operator to register to 3 registration denied 4 unknown (e.g. out of E-UTRAN coverage) 5 registered, roaming 6 registered for "SMS only", home network (not applicable) 7 registered for "SMS only", roaming (not applicable) 8 attached for emergency bearer services only (See NOTE 2) 9 registered for "CSFB not preferred", home network (not applicable) 10 registered for "CSFB not preferred", roaming (not applicable) NOTE 2: 3GPP TS 24.008 [8] and 3GPP TS 24.301 [83] specify the condition when the MS isconsidered as attached for emergency bearer services. 11attached for emergency bearer services only</reject_cause></cause_type></act></ci></tac></stat></pre> |

| <tac></tac>                   | string type; two byte tracking area code in hexadecimal format (e.g. "00C3" equals 195 in decimal)   |
|-------------------------------|--|
| <ci></ci>                     | string type; four byte E-UTRAN cell ID in hexadecimal format   |
| <act></act>                   | integer type; indicates the access technology of the serving cell  0 GSM (not applicable)  1 GSM Compact (not applicable)  2 UTRAN (not applicable)  3 GSM w/EGPRS (see NOTE 3) (not applicable)  4 UTRAN w/HSDPA (see NOTE 4) (not applicable)  5 UTRAN w/HSUPA (see NOTE 4) (not applicable)  6 UTRAN w/HSDPA and HSUPA (see NOTE 4) (not applicable)  7 E-UTRAN  8 EC-GSM-IoT  9 E-UTRAN(NB-S1 mode)  NOTE 3: 3GPP TS 44.060 [71] specifies the System Information messages which give the information about whether the serving cell supports EGPRS.  NOTE 4: 3GPP TS 25.331 [74] specifies the System Information blocks which give the information about whether the serving cell supports HSDPA or HSUPA. |
| <cause_type></cause_type>     | integer type; indicates the type of <reject_cause>.  0 Indicates that <reject_cause> contains an EMM cause value, see 3GPP TS 24.301 [83] Annex A.  1 Indicates that <reject_cause> contains a manufacturer-specific cause.</reject_cause></reject_cause></reject_cause>   |
| <reject_cause></reject_cause> | integer type; contains the cause of the failed registration. The value is of type as defined by <cause_type>.</cause_type>   |

# 4.7 AT+CPSI Inquiring UE System Information

This command is used to return the UE system information.

| Test Command AT+CPSI=? | Response +CPSI: (scope of <time>)</time> |

## **5.MT control and status Commands**

## **5.1 AT+CFUN** Set Phone Functionality

Set command selects the level of functionality <fun> in the MT.

| Test Command AT+ CFUN=?                          | Response +CFUN: (list of supported <fun>s), (list of supported <rst>s) OK or +CME ERROR: <err></err></rst></fun>   |
|--|--|
| Write Command AT+CFUN= <fun>[,<rst>]</rst></fun> | Response OK or +CME ERROR: <err> Note: Currently, CFUN=5 is not supported to switch to CFUN=0. Please switch to CFUN=1 before switching back to CFUN=0</err> |
| Read Command AT+CFUN?                            | Response +CFUN: <fun> OK Or +CME ERROR: <err></err></fun>  |

| Parameters  | Description   |
|-------------|---|
| <fun></fun> | <ul> <li>minimum functionality</li> <li>full functionality</li> <li>disable phone receive RF circuits</li> <li>disable phone both transmit and receive RF circuits (supported only for module solution)</li> <li>disable SIM</li> </ul> |
| <rst></rst> | 0 do not reset the MT before setting it to <fun> power level 1 reset the MT before setting it to <fun> power level</fun></fun>  |

#### 5.2 AT+CPIN Enter PIN

Set command sends to the ME a password which is necessary before it can be operated (SIM PIN, SIM PUK, PH-SIM PIN, etc.). If the PIN is to be entered twice, the TA shall automatically repeat the PIN. If no PIN request is pending, no action is taken towards ME and an error message, +CME ERROR, is returned to TE. Refer [1] 9.2 for possible <err>
values.

If the PIN required is SIM PUK or SIM PUK2, the second pin is required. This second pin, <newpin>, is used to replace the old pin in the SIM.

| Test Command   | Response                |
|--|-------------------------|
| AT+ CPIN=?   | OK                      |
|  | or                      |
|  | +CME ERROR: <err></err> |
| Read Command   | Response                |
| AT+ CPIN?  | +CPIN: <code></code>    |
|  | OK                      |
|  | or                      |
|  | +CME ERROR: <err></err> |
| Write Command  | Response                |
| AT+CPIN= <pin>[,<newp< td=""><td>OK</td></newp<></pin> | OK                      |
| in>]   | or                      |
|  | +CME ERROR: <err></err> |
|  |                         |

| Parameters             | Description   |
|------------------------|---|
| <pin></pin>            | String type values                                      |
| <pre><pre></pre></pre> | String type values new pip ofter chips shock need       |
| <newpin></newpin>      | String type values,new pin after <pin> check pass</pin> |
|                        |   |

### 5.3 AT+CSQ Signal Quality

The command returns received signal strength indication<rssi> and channel bit error rate <ber> from the ME

Execution Command Response

AT+ CSQ +CSQ: <rssi>,<ber>

OK or

+CME ERROR:<err>

| Test Command | Response           |
|--------------|--------------------|
| AT+CSQ=?     | +CSQ: (0-31),(0-7) |
|              | ОК                 |
|              |                    |
|              |                    |

| Parameters                       | Description   |
|----------------------------------|---|
| <rssi></rssi>                    | 0-113dBm or less 1 -111dBm 230 -10953dBm 31-51dBm or greater 99 not known or not detectable   |
| <br><br><br><br><br><br><br><br> | <ul><li>07 as RXQUAL values in the table in TS 45.008 [20] subclause</li><li>8.2.4</li><li>99 not known or not detectable</li></ul> |

#### 5.4 AT+CIND Indicator control

Displays the value of ME indicators

| Test Command AT+CIND=?                               | Response +CIND: ("service",(0-1)) OK or +CME ERROR: <err></err>              |
|--|--|
| Read Command AT+CIND?                                | Response +CIND: <ind>[,<ind>[,]]  OK  or +CME ERROR: <err></err></ind></ind> |
| Write Command AT+CIND=[ <ind>[,<ind>[,]]</ind></ind> | Response  OK  or +CME ERROR: <err></err>                                     |
| Reference note:                                      | Note "call setup" is proprietary defined and only used when BT supported.    |

| <pre><ind> integer type value, which shall be in range of corresponding <descr></descr></ind></pre>  | Parameters  | Description  |
|--|-------------|--|
| "battchg" battery charge level (0-5)  "signal" s ignal quality (0-5)  "service" service availability (0-1)  "sounder" (0-1)  "message" message received (0-1)  "call" call in progress (0-1)  "roam" roaming indicator (0-1) | <ind></ind> | ranges: "battchg" battery charge level (0-5) "signal" s ignal quality (0-5) "service" service availability (0-1) "sounder" (0-1) "message" message received (0-1) "call" call in progress (0-1) "roam" roaming indicator (0-1) "smsfull" a short message memory storage in the MT has become full(1) |

#### 5.5 AT+CCLK Clock

Set command sets the real-time clock of the MT. Read command returns the current setting of the clock.

| Response                |
|-------------------------|
| OK                      |
| Response                |
| +CCLK: <time></time>    |
| OK                      |
| or                      |
| +CME ERROR: <err></err> |
| Response                |
| OK                      |
| or                      |
| +CME ERROR: <err></err> |
|                         |
|                         |

| Parameters    | Description   |
|---------------|---|
| <time></time> | string type value; format is "yy/MM/dd,hh:mm:ss+timezone",                |
| \uniter       | where characters indicate year (two last digits), month, day, hour,       |
|               | minutes, seconds.If does not support timezone,the <time> format is</time> |
|               | "yy/MM/dd,hh:mm:ss"or"yy/MM/dd,hh:mm:ss+"                                 |

## 5.6 AT+QNTP set automatic time to ntp server

This command is used to set automatic to ntp server

| Write Command AT+QNTP= <mode></mode> | Response OK or +CME ERROR: <err></err>                     |
|--------------------------------------|--|
| Read Commands AT+QNTP?               | Response +NTP: <mode> OK or +CME ERROR: <err></err></mode> |
| Test Command AT+QNTP=?               | Response +NTP: (enable/disable) OK                         |

Parameters are defined below:

| Parameters    | Description   |
|---------------|---|
| <mode></mode> | Integer type value indicating:  0 Disable automatic time zone update via NTP Server(default).  1 Enable automatic time zone update via NTP Server |

#### 5.7AT+CTZR Time Zone Reporting

Enable/Disable the time zone change event reporting. If the reporting is enabled the MT returns the unsolicited result code +CTZV: <tz> whenever the time zone is changed.

| Write Command          | Response                |
|------------------------|-------------------------|
| AT+CTZR= <mode></mode> | OK                      |
|                        | or                      |
|                        | +CME ERROR: <err></err> |
|                        |                         |
| Read Commands          | Response                |
| AT+CTZR?               | +CTZR: <mode></mode>    |
|                        | OK                      |
|                        | or                      |
|                        | +CME ERROR: <err></err> |

| Test Command AT+CTZR=? | Response +CTZR: (list of supported <mode>s) OK</mode>   |
|------------------------|---|
| Reference note         | Note China Mobile card only. Send AT+CTZR=1 command immediately when modem starting up;or send the following commands in order AT+CTZR=1、AT+CFUN=0、AT+CFUN=1. |

| Parameters    | Description  |
|---------------|--|
|               |  |
| <mode></mode> | Integer type value indicating:                         |
|               | 0 Disable automatic time zone update via NITZ.         |
|               | 1 Enable automatic time zone update via NITZ(default). |

# **6.GPRS Commands**(27.007)

#### 6.1 AT+CGDCONT Define PDP Context

This command is used to Specifies PDP context parameter values for a PDP context identified by the (local) context identification parameter, <cid>.

| ` '  |   |
|--|---|
| Test Command AT+CGDCONT=?  | <pre>Response +CGDCONT: (range of supported <cid>s), <pdp_type>,,,(list of supported <d_comp>s), (list of supported <h_comp>s)[,(list of supported <pd1>s)[,[,(list of supported <pdn>s)]]] [<cr><lf>+CGDCONT: (range of supported <cid>s), <pdp_type>,,,(list of supported <d_comp>s), (list of supported <h_comp>s)[,(list of supported <pd1>s)[,[,(list of supported <pdn>s)]]] []] OK</pdn></pd1></h_comp></d_comp></pdp_type></cid></lf></cr></pdn></pd1></h_comp></d_comp></pdp_type></cid></pre> |
| Read Command AT+CGDCONT?   | Response +CGDCONT: <cid>, <pdp_type>, <apn>, <pdp_addr>, <d_comp>, <h_comp>[,<pd1>[,[,pdN]]] [<cr><lf>+CGDCONT: <cid>, <pdp_type>, <apn>,<pdp_addr>, <d_comp>, <h_comp>[,<pd1>[,[,pdN]]] [] OK</pd1></h_comp></d_comp></pdp_addr></apn></pdp_type></cid></lf></cr></pd1></h_comp></d_comp></pdp_addr></apn></pdp_type></cid>  |
| Write Command AT+CGDCONT= <cid>[,&lt; PDP_type&gt;[,<apn> [,<pdp_addr> [,<d_comp>[,<h_comp> [,<pd1>[,[,pdN]]]]]]]]]</pd1></h_comp></d_comp></pdp_addr></apn></cid> | Response  |

| Reference | Note   |
|-----------|--|
|           | Only set 1 PDP channel parameter(APN,pdptype,cid etc) to execute |
|           | AT+CGACT=1 ,1 and active PDP context.                            |
|           |  |

| Parameters                  | Description  |
|-----------------------------|--|
| <cid></cid>                 | (PDP Context Identifier) a numeric parameter which specifies a particular PDP context definition. The parameter is local to the TE-MT interface and is used in other PDP context-related commands. The range of permitted values (minimum value = 1) is returned by the test form of the command.  |
| <pdp_type></pdp_type>       | (Packet Data Protocol type) a string parameter.  IP Internet Protocol (IETF STD 5)   |
| <apn></apn>                 | (Access Point Name) a string parameter which is a logical name that is used to select the GGSN or the external packet data network. If the value is null or omitted, then the subscription value will be requested.  |
| <pdp_address></pdp_address> | a string parameter that identifies the MT in the address space applicable to the PDP.  If the value is null or omitted, then a value may be provided by the TE during the PDP startup procedure or, failing that, a dynamic address will be requested.  The read form of the command will continue to return the null string even if an address has been allocated during the PDP startup procedure. The allocated address may be read using the +CGPADDR command. |
| <d_comp></d_comp>           | a numeric parameter that controls PDP data compression (applicable for SNDCP only)0 - off (default if value is omitted)  |
| <h_comp></h_comp>           | a numeric parameter that controls PDP header compression 0 - off (default if value is omitted)   |
| <pd1>,<pdn></pdn></pd1>     | zero to N string parameters whose meanings are specific to the <pdp_type></pdp_type>   |

#### 6.2 AT+CGATT PS attach or detach

The execution command is used to attach the MT to, or detach the MT from, the Packet Domain service. After the command has completed, the MT remains in V.250 command state

| Test Command                            | Response  |
|---|---|
| AT+CGATT =?                             | +CGATT: (list of supported <state>s) OK</state>               |
| Read Command AT+CGATT?                  | Response +CGATT: <state> OK or +CME ERROR:<err></err></state> |
| Write Command AT+CGATT= <state></state> | Response +CGATT: <state> OK</state>                           |

| Parameters      | Description                          |
|-----------------|--------------------------------------|
| <state></state> | indicates the state of PS attachment |
|                 | 0 detached                           |
|                 | 1 attached                           |

## 6.3 AT+CGACT PDP Context activate or deactivate

+CME ERROR:<err>

This command is used to active PDP Context ,but not update PDP Context information to lwip netif ,so after this command can't directly use connect tcp socket

| Test Command  | Response   |
|---|--|
| AT+CGACT=?  | +CGACT: (list of supported <state>s)</state>   |
|   | OK   |
| Read Command  | Response   |
| AT+CGACT?   | +CGACT: <cid>, <state>[<cr><lf>+CGACT: <cid>, <state>[]]</state></cid></lf></cr></state></cid> |
|   | OK   |
|   |  |
| Write Command   | Response   |
| AT+CGACT= <state>[,<c< td=""><td>OK</td></c<></state> | OK   |
| id>]  | or   |
|   | +CME ERROR: <err></err>  |
| Parameters are defined bel                            | OW:  |

Description

Parameters

| <state></state> | indicates the state of PDP context activation  0 deactivated  1 activated  Other values are reserved and will result in an ERROR response to the  |
|-----------------|---|
| <cid></cid>     | execution command.  a numeric parameter which specifies a particular PDP context definition.  If no <cid>isspecified, then UE will return ERROR. The usage of omitted <cid> to activate/deactivate.</cid></cid> |

#### 6.4 AT+CGDATA Enter data state

The execution command causes the MT to perform whatever actions are necessary to establish communication between the TE and the network using one or more Packet Domain PDP types.

| Write Command   | Response   |
|---|--|
| AT+CGDATA= <l2p> ,<c< td=""><td>CONNECT</td></c<></l2p> | CONNECT  |
| id>   | or   |
|   | +CME ERROR: <err></err>                          |
|   |  |
| Test Command  | Response   |
| AT+ CGDATA=?  | +CGDATA: (list of supported <l2p>s),(1-16)</l2p> |
| · ·   | ОК   |
|   |  |

#### Parameters are defined below:

| Parameters  | Description  |
|-------------|--|
| <l2p></l2p> | a string parameter that indicates the layer 2 protocol to be used between the TE and MTPPP Point-to-point protocol for a PDP such as IP Other values will result in an ERROR response.  PPP Point-to-point protocol for a PDP such as IP |
| <cid></cid> | a numeric parameter which specifies a particular PDP context definition (see the +CGDCONT command).  Range from 1 to 16.   |

#### 6.5 AT+CGPADDR Show PDP address

The execution command returns a list of PDP addresses for the specified context identifiers. The test command returns a list of defined <cid>s.

| Write Command                 | Response  |
|-------------------------------|---|
| AT+CGPADDR= <cid>[,&lt;</cid> | +CGPADDR:   |
| cid>[,]]                      | <cid>,<pdp_addr>[<cr><lf>+CGPADDR:<cid>,<pdp_addr>[]]</pdp_addr></cid></lf></cr></pdp_addr></cid> |
|                               | OK  |
|                               | Or  |
|                               | +CME ERROR: <err></err>   |
| Test Command                  | Response  |
| AT+CGPADDR=?                  | +CGPADDR: (list of defined <cid>s)</cid>  |
|                               | ОК  |
|                               |   |

| Parameters                  | Description  |
|-----------------------------|--|
| <cid></cid>                 | a numeric parameter which specifies a particular PDP context definition (see the +CGDCONT command). If no <cid> is specified, an ERROR result code will be returned. Multiple <cid> field is not supported. For a dynamic address it will be the one</cid></cid>   |
| <pdp_address></pdp_address> | a string that identifies the MT in the address space applicable to the PDP. The addressmay be static or dynamic. For a static address, it will be the one set by the +CGDCONT and assigned during the last PDP context activation that used the context definition referred to by <cid>.<pdp_address> is omitted if none is available.</pdp_address></cid> |

## 6.6 AT+CELLINFO Get Nearby Cell Information

This command is used to get Nearby cell information

| Read Command | Response  |
|--------------|---|
| AT+CELLINFO? | +CELLINFO: <net_mode>,<net></net></net_mode>            |
|              | <nmr_1><nmr_n></nmr_n></nmr_1>                          |
|              | <nmr_1><nmr_n></nmr_n></nmr_1>                          |
|              |   |
|              | OK  |
|              |   |
|              | Nearby cell information for GSM                         |
|              | For current and nearby cell                             |
|              | <lac>,<cell_id>,<rssi></rssi></cell_id></lac>           |
|              | Nearby cell information for LTE                         |
|              | For current cell:                                       |
|              | <tac>,<cell_id>,<rssi></rssi></cell_id></tac>           |
|              | For nearby cell:  |
|              | <lac>,<earfcn>,<pci>,<rssi></rssi></pci></earfcn></lac> |

| Parameters <net_mode></net_mode> | Descripton  1 LTE |
|----------------------------------|-------------------|
| <net></net>                      | LTE               |

## 7. Hardware Testing AT Commands

## 7.1 AT+CGDRT Set the Direction of Specified GPIO

This Command is used to Set the direction of specified GPIO

| Write Command  | Response  |
|--|---|
| AT+CGDRT= <gpio_num< th=""><th>This command is used to set the specified GPIO to input or</th></gpio_num<> | This command is used to set the specified GPIO to input or      |
| >, <gpio_io></gpio_io>   | output state. If setting to input state, then this GPIO can not |
|  | be set to high or low value.                                    |
|  | OK  |
| Write Command  | Response  |
| AT+CGDRT= <gpio_num< th=""><th>When only one parameter is used to read the configuration</th></gpio_num<>  | When only one parameter is used to read the configuration       |
| >  | of the current GPIO port  |
|  | +CGDRT: <gpio_num>,<gpio_io></gpio_io></gpio_num>               |
|  | ОК  |
|  | or  |
|  | +CME ERROR: <err></err>   |
| Test Command   | Response  |
| AT+CGDRT=?   | +CGDRT: (list of supported< gpio_num >s),(list of               |
|  | supported< gpio_io >s)  |
|  | OK  |

Parameters are defined below:

| Parameters            | Description                  |
|-----------------------|------------------------------|
| <gpio_num></gpio_num> | supported operating gpio num |
| <gpio_io></gpio_io>   | 0 – in<br>1 – out            |

## 7.2 AT+CGSETV Set the Value of Specified GPIO

This Command is used to Set the Value of Specified GPIO

| Response  |
|---|
| This command is used to set the value of the specified  |
| GPIO to high or low. GPIO should first be set to output |
| mode with +CGDRT  |
| OK  |
|   |

| Test Command | Response   |
|--------------|--|
| AT+CGSETV=?  | +CGSETV: (list of supported< gpio_num >s),(list of |
|              | supported< gpio_ hl >s)                            |
|              | ОК   |
|              |  |

| Parameters            | Description                  |
|-----------------------|------------------------------|
| <gpio_num></gpio_num> | supported operating gpio num |
| <gpio_hl></gpio_hl>   | 0 – low<br>1 – high          |

## 7.3 AT+CGGETV Get the Value of Specified GPIO

This Command is used to get the Value of Specified GPIO

| Write Command   | Response   |
|---|--|
| AT+CGGETV= <gpio_nu< th=""><th>This command is used to get the value (high or low) of the</th></gpio_nu<> | This command is used to get the value (high or low) of the |
| m>  | specified GPIO. GPIO should first be set to intput mode    |
|   | with +CGDRT  |
|   | +CGGETV: <gpio_num>,<gpio_hl></gpio_hl></gpio_num>         |
|   | ОК   |
| Test Command  | Response   |
| AT+CGGETV=?   | +CGDRT: list of supported< gpio_num >s                     |
|   | OK   |
|   |  |

#### Parameters are defined below:

| Parameters            | Description                  |
|-----------------------|------------------------------|
| <gpio_num></gpio_num> | supported operating gpio num |
| <gpio_hl></gpio_hl>   | 0 – low<br>1 – high          |

#### 7.5 AT+CGNETLED Network LED Control

This command is used to set the Network LED state to enable or disable

Write Command Response
AT+CGNETLED=<mode
>

Test Command Response

AT+CGNETLED=? +CGNETLED: (list of supported <mode>s)

OK

Read Command Response

AT+CGNETLED? +CGNETLED: <mode>

OK

Parameters are defined below:

| Parameters    | Description |  |
|---------------|-------------|--|
| <mode></mode> | 0 – disable |  |
|               | 1 – enable  |  |

## 7.6 AT+SYSSLEEP Configure System Sleep

This Command is used to Configure syssleep

Write Command Response
AT+SYSSLEEP= <n> OK

Read Command
AT+SYSSLEEP?

Page 4-SYSSLEEP:n
OK
Or
+CME ERROR:<err>
Test Command
AT+ SYSSLEEP=?

Response
+SYSSLEEP: (0-1)
OK

Parameters are defined below:

Parameters Description

| n | 0: not sleep |
|---|--------------|
|   | 1: sleep     |

## 7.7 AT+CSCLK Configure Slow Clock

This Command is used to Configure Slow Clock.

|                                 | <del>-</del>                                     |
|---------------------------------|--|
| Write Command AT+CSCLK= <n></n> | Response <b>OK</b>                               |
| Read Command AT+CSCLK?          | Response +CSCLK:n OK or +CME ERROR: <err></err>  |
| Test Command AT+CSCLK=?         | Response +CSCLK: (list of supported <n>s) OK</n> |

#### Parameters are defined below:

| Parameters | Description   |
|------------|---|
| <n></n>    | <ul> <li>0 Disable slow clock, module will not enter sleep mode.</li> <li>1 Enable slow clock, it is controlled by DTR. When DTR is high, module can enter sleep mode. When DTR changes to low level, module can quit sleep mode.</li> <li>2 Enable slow clock, it is controlled by WakeUp, Whe WakeUp Pin is high, module can enter sleep mode. When WakeUp Pin changes to low level, module can quit sleep mode.</li> </ul> |

#### 7.8 AT+ RESET Reboot the Module

This Command is used to reboot the module

| Write Command | Response |
|---------------|----------|
| AT+RESET      | OK       |
|               |          |
|               |          |
|               |          |

#### 7.9 AT+POWEROFF Power off the Module

This Command is used to poweroff .the module

| Write Command | Response |
|---------------|----------|
| AT+POWEROFF   | OK       |
|               |          |
|               |          |
|               |          |

#### 7.10 AT+FLOWCTRL Control UART Flow Control

This command is used to control uart flow control

| Write Command AT+FLOWCTRL= <optio n=""></optio> | Response OK Or +CME ERROR  |  |
|---|--|--|
| Read Command AT+FLOWCTRL?                       | Response +FLOWCTRL: <option> OK Or +CME ERROR:<err></err></option> |  |
| Test Command AT+FLOWCTRL=?                      | Response<br>+FLOWCTRL: (0-1)<br>OK                                 |  |

Parameters are defined below:

| Parameters        | Description  |
|-------------------|--|
| <option></option> | <ul> <li>0 close uart flow control</li> <li>1 start uart flow control</li> <li>default value is 0</li> </ul> |

#### 7.11 AT+GTPOS Get Station Positioning

The command is used to retrieve information base station positioning (not support CDMA network).

| Write Command AT+GTPOS= <mode></mode> | Response <mode>=0: OK <mode>=1: CONNECT OK CONNECT FAILED ERROR <mode>=2: OK +GTPOS: <longitude>,<latitude></latitude></longitude></mode></mode></mode> |
|---------------------------------------|---|
| Read Command AT+GTPOS?                | Response +GTPOS: <mode> OK</mode>   |
| Test Command AT+GTPOS=?               | Response +GTPOS: (list of supported <mode>s) OK</mode>  |

| Parameters    | Description  |
|---------------|--|
| <mode></mode> | <ul><li>0 - Close the base station positioning function</li><li>1 - Open the base station positioning function</li><li>2 - Get the base station positioning function</li></ul> |
| Example:      |  |
| Commands      | Response   |
| AT+GTPOS=1    | OK<br>CONNECT OK   |
| AT+GTPOS=2    | +GTPOS:104.0553231,30.5497824<br>OK  |
| AT+GTPOS=0    | ОК   |

#### 7.12 AT+MGPSC turn on or off GPS

The command is used to turn on or off GPS

| Write Command AT+MGPSC= <mode></mode> | Response OK or ERROR              |
|---------------------------------------|-----------------------------------|
| Read Command AT+MGPSC?                | Response +MGPSC: <mode> OK</mode> |

| Parameters    | Description                   |  |
|---------------|-------------------------------|--|
| <mode></mode> | 0 - Close GPS<br>1 - Open GPS |  |

#### 7.13 AT+GPSMODE Setting GPS mode

The command is used to setting GPS Mode

| Write Command             | Response                |
|---------------------------|-------------------------|
| AT+GPSMODE= <mode></mode> | OK                      |
|                           | or                      |
|                           | ERROR                   |
|                           |                         |
| Test Command              | Response                |
| AT+GPSMODE=?              | +GPSMODE: <mode></mode> |
|                           | ОК                      |
|                           |                         |
|                           |                         |

| Parameters    | Description   |
|---------------|---|
| <mode></mode> | <ul><li>1- hot mode</li><li>2 - mild mode</li><li>3 cold mode</li></ul> |

#### 7.14 AT+GPSINIT start GPS

The command is used to start GPS

Write Command

AT+GPSINIT=<mode>
OK
or
ERROR

Read Command
AT+MGPSC?

+MGPSC:<mode>
OK

Parameters are defined below:

Parameters

Description

1 download GPS FW
2 GPS enter sleep mode

## 7.15 AT+AGNSSGET download GPS assisted positioning data

The command is used to start GPS

Write Command Response

AT+AGNSSGET=<agps OK
\_server\_addr> or
ERROR

Read Command Response

AT+AGNSSGET? +AGNSSGET:

OK

Parameters are defined below:

Parameters

Description

<agps\_server\_addr>

pos.asrmicro.com

## 7.16 AT+AGNSSSET send GPS assisted positioning data to GPS

#### chip

The command is used to start GPS

| Write Command | Response   |
|---------------|------------|
| AT+AGNSSSET   | OK         |
|               | or         |
|               | ERROR      |
|               |            |
| Read Command  | Response   |
| AT+AGNSSSET   | +AGNSSSET: |
|               | OK         |

## 7.17 AT+WAKEUPCFG Wakeup Service Config

The command is used to configurewakeup service.

| Write Command  | Response   |  |
|--|--|--|
| AT+WAKEUPCFG= <mo< td=""><td colspan="2">This command is used to configure wakeup host function</td></mo<> | This command is used to configure wakeup host function |  |
| de>[, <gpio>]</gpio>   | OK or ERROR  |  |
| Read Command   | Response   |  |
| AT+WAKEUPCFG?  | +WAKEUPCFG: <mode>,<gpio></gpio></mode>                |  |
|  | OK   |  |
| Test Command   | Response   |  |
| AT+WAKEUPCFG=?   | +WAKEUPCFG: (0-7),(0-1)                                |  |
|  | ОК   |  |

| Parameters | Description |
|------------|-------------|
|            |             |

| <mode></mode> | Range:0 to 7(default is 3)                |  |
|---------------|---|--|
|               | Description:                              |  |
|               | 0: close wakeup host function             |  |
|               | 1: call wakeup host function              |  |
|               | 2: sms wakeup host function               |  |
|               | 3: call and sms wakeup host function      |  |
|               | 4: data wakeup host function              |  |
|               | 5: call and data wakeup host function     |  |
|               | 6: data and sms wakeup host function      |  |
|               | 7: call sms and data wakeup host function |  |
| <gpio></gpio> | Range:0 to 1(default is 0)                |  |
|               | 0:select ri port to outputpulse.          |  |
|               | 1:select wakeup out port to output pulse. |  |

#### Example:

| Commands          | Response |  |
|-------------------|----------|--|
| AT+ WAKEUPCFG=3,1 | ОК       |  |

# 8. Proprietary AT Commands For PS

## 8.1 AT+CESQ Received signal level indication

Set command to enable +ECSQ unsolicited result code .to indicate the received signal level.

| Execute Command | Response   |
|-----------------|--|
| AT+CESQ         | +CESQ: <rssi>,<ber>,<rscp>,<ecno>,<rsrq>,<rsrp></rsrp></rsrq></ecno></rscp></ber></rssi> |
|                 | ОК   |
|                 | or   |
|                 | +CME ERROR: <err></err>  |
| Test Command    | Response   |
| AT+CESQ=?       | +CESQ: (range of supported <rssi>s),( range of</rssi>                                    |
|                 | supported <ber>s), (range of supported <rscp>s),</rscp></ber>                            |
|                 | (range of supported <ecno>s), (range of supported</ecno>                                 |
|                 | <rsrq>s), (range of supported <rsrp>s)</rsrp></rsrq>                                     |
|                 | OK   |

| Parameters | Description   |
|------------|---|
| rssi       | Received signal strengthindication  0 <rssi>&lt; -110dBm  1 -110dBm ≤ <rssi>&lt; -109dBm  2 -109dBm ≤ <rssi>&lt; -108dBm   61 -50dBm ≤ <rssi>&lt; -49dBm  62 -49dBm ≤ <rssi>&lt; -48dBm  63 -48dBm ≤ <rssi>&gt;  99 not known or not detectable</rssi></rssi></rssi></rssi></rssi></rssi> |
| ber        | integer type; channel bit error rate (in percent)  07 as RXQUAL values in the table in 3GPP TS 45.008 [20] subclause 8.2.4  99 not known or not detectable  |

| <rscp></rscp> | integer type, received signal code power (see 3GPP TS 25.133 [95] subclause 9.1.1.3 and 3GPP TS 25.123 [96] subclause 9.1.1.1.3).  0 rscp< -120 dBm 1 -120 dBm ? rscp< -119 dBm 2 -119 dBm ? rscp< -118 dBm 94 -27 dBm ? rscp< -26 dBm 95 -26 dBm ? rscp< -25 dBm 96 - 25 dBm ? rscp  |
|---------------|---|
| <ecno></ecno> | integer type, ratio of the received energy per PN chip to the total received power spectral density (see 3GPP TS 25.133 [95] subclause).  0 Ec/lo < -24 dB  1 -24 dB ? Ec/lo < -23.5 dB  2 -23.5 dB ? Ec/lo < -23 dB  47 -1 dB ? Ec/lo < -0.5 dB  48 -0.5 dB ? Ec/lo < 0 dB  49 0 dB ? Ec/lo  255 not known or not detectable |
| <rsrq></rsrq> | integer type, reference signal received quality (see 3GPP TS 36.133 [96] subclause 9.1.7).  0 rsrq< -19.5 dB  1 -19.5 dB ? rsrq< -19 dB  2 -19 dB ? rsrq< -18.5 dB  32 -4 dB ? rsrq<-3.5 dB  33 -3.5 dB ? rsrq< -3 dBC  |
| <rsrp></rsrp> | integer type, reference signal received power (see 3GPP TS 36.133 [96] subclause 9.1.4).  0 rsrp< -140 dBm  1 -140 dBm ? rsrp< -139 dBm  2 -139 dBm ? rsrp< -138 dBm  95 -46 dBm ? rsrp< -45 dBm  96 -45 dBm ? rsrp< -44 dBm  97 -44 dBm ? rsrp  255 not known or not detectable  |

#### 8.2 AT+CCID Read CCID of SIM Card

This command is used to read SIM card ICCID if SIM inserted. If SIM not inserted, return +CME ERROR: 10

| Execution Command | Response                |
|-------------------|-------------------------|
| AT+CCID           | +CCID: <iccid></iccid>  |
|                   | OK                      |
|                   | or                      |
|                   | +CME ERROR: <err></err> |

| Parameters      | Description |
|-----------------|-------------|
| <iccid></iccid> | String type |

# 9. Proprietar Unsolicited Result Code

#### 9.1 URC:+CESQ

This URC is to report signal strength

| Execution Command | Response   |
|-------------------|--|
|                   | Unsolicited result code  |
|                   | +CESQ: <rssi>,<ber>,<rscp>,<ecno>,<rsrq>,<rsrp></rsrp></rsrq></ecno></rscp></ber></rssi> |
|                   |  |

| Parameters    | Description   |
|---------------|---|
| <rssi></rssi> | 0-255 Received signal strength indication level   |
| <br><br>      | integer type; channel bit error rate (in percent)  07 as RXQUAL values in the table in 3GPP TS 45.008 [20] subclause 8.2.4  99 not known or not detectable  |
| <rscp></rscp> | integer type, received signal code power (see 3GPP TS 25.133 [95] subclause 9.1.1.3 and 3GPP TS 25.123 [96] subclause 9.1.1.3).  0 rscp< -120 dBm 1 -120 dBm ? rscp< -119 dBm 2 -119 dBm ? rscp< -118 dBm 94 -27 dBm ? rscp< -26 dBm 95 -26 dBm ? rscp< -25 dBm 96 - 25 dBm ? rscp  |
| <ecno></ecno> | integer type, ratio of the received energy per PN chip to the total received power spectral density (see 3GPP TS 25.133 [95] subclause).  0 Ec/lo < -24 dB  1 -24 dB ? Ec/lo < -23.5 dB  2 -23.5 dB ? Ec/lo < -23 dB  47 -1 dB ? Ec/lo < -0.5 dB  48 -0.5 dB ? Ec/lo < 0 dB  49 0 dB ? Ec/lo  255 not known or not detectable |

| <rsrq></rsrq> | integer type, reference signal received quality (see 3GPP TS 36.133 [96] subclause 9.1.7).  0 rsrq< -19.5 dB  1 -19.5 dB ? rsrq< -19 dB  2 -19 dB ? rsrq< -18.5 dB  32 -4 dB ? rsrq< -3.5 dB  33 -3.5 dB ? rsrq< -3 dBC                        |
|---------------|--|
| <rsrp></rsrp> | integer type, reference signal received power (see 3GPP TS 36.133 [96] subclause 9.1.4).  0 rsrp< -140 dBm  1 -140 dBm ? rsrp<-139 dBm  2 -139 dBm ? rsrp< -138 dBm  95 -46 dBm ? rsrp< -45 dBm  96 -45 dBm ? rsrp< -44 dBm  97 -44 dBm ? rsrp |

#### 9.2 URC:\*ATREADY

AT command to indicate that AT command server is ready to handler AT commands

| Execution Command | Response                    |
|-------------------|-----------------------------|
|                   | *ATREADY: <bready></bready> |
|                   |                             |
|                   |                             |

Parameters are defined below:

| Parameters   | Description |
|--|-------------|
| <br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br> | 1 ready     |
|  | 0 not ready |

#### 9.3 URC:+NITZ

NITZ, or Network Identity and Time Zone, is a mechanism for provisioning local time and date information to mobile devices via a wireless network

| Execution Command | Response   |
|-------------------|--|
|                   | +NITZ: <dst>[,<sign><timezone>[,<year>/<month>/<day>,<hour>:</hour></day></month></year></timezone></sign></dst> |
|                   | <minute>:<second>]]</second></minute>  |
|                   |  |

| Parameters        | Description   |
|-------------------|---|
| <year></year>     | The integer value is in range [0099]  |
| <month></month>   | The integer value is in range [112].  |
| <day></day>       | The integer value is in range [131]   |
| <hour></hour>     | The integer value is in range [024]   |
| <minute></minute> | The integer value is in range [059]   |
| <second></second> | The integer value is in range [059]   |
| <sign></sign>     | a char value  '+' – local time zone is passive.  '-' – local time zone is negative. |
| <dst></dst>       | Daylight Saving Time (DST),also summer time.  0 no adjustment  1 +1 hour  2 +2 hour |
| Example:          |   |
|                   | +NITZ: 0,"+32","11/08/02","09:27:39"  |

#### 9.4 URC:+MMSG

Indicate an Short Messages Storage status change

| Execution Command | Response   |
|-------------------|--|
|                   | +MMSG: <smsready>,<smsfull></smsfull></smsready> |
|                   |  |
|                   |  |

| Parameter             | Description   |
|-----------------------|---|
| <smsready></smsready> | indicates if the SIM is ready for SMS 0 not ready 1 ready |

| <smsfull></smsfull> | indicates if the memory capacity of SIM for SMS has been reached |
|---------------------|--|
|                     | 0 not reached  |
|                     | 1 reached  |
|                     |  |

#### 9.6 URC:+CGEV

Indication from MT to TE in the case of certain events occurring in the Packet Domain MT or the network. Refer to the details in AT+CGEREP

| Execution Command | Response<br>+CGEV:XXX |  |
|-------------------|-----------------------|--|
|                   |                       |  |
|                   |                       |  |

## **10.TCPIP AT Commands**

## 10.1 AT+QICSGP Configure APN

This command is used to configure apn, username , password

| Read Command AT+QICSGP?   | Response +QICSGP: <cid>,<context_type>,<apn>,<username>,<password> OK</password></username></apn></context_type></cid>  |
|---|---|
| Write Command AT+QICSGP= <cid>,<c ontexttype="">,<apn>, <username>,<password></password></username></apn></c></cid> | Response OK or ERROR  |
| Test Command AT+QICSGP=?  | Response +QICSGP: (list of supported <cid>s), (list of supported <context_type>s,<apn>,<username>,<password>,<authentication>) OK</authentication></password></username></apn></context_type></cid> |
| Reference   | Note  |

| Parameters                    | Description                            |
|-------------------------------|--|
| <cid></cid>                   | 1-6                                    |
| <context_type></context_type> | Connect type 1: IPV4 2: IPV4V6 3: IPV6 |
| <apn></apn>                   | string                                 |
| <username></username>         | string                                 |

| <password></password>             | string   |
|-----------------------------------|----------|
| <authentication></authentication> | Int type |
|                                   | 0 none   |
|                                   | 1 PAP    |
|                                   | 2 CHAP   |

## 10.2 AT+NETOPEN Active PDP Context and Open packet network

This command is used to open packet network.

| Read Command AT+NETOPEN?  | Response + NETOPEN: <net_state> OK</net_state> |
|---------------------------|--|
| Write Command AT+NETOPEN  | Response OK +NETOPEN: <err> or ERROR</err>     |
| Test Command AT+NETOPEN=? | Response<br>OK                                 |

#### Parameters are defined below:

| Parameters                                 | Description  |
|--|--|
| <pre><pre><net state=""></net></pre></pre> | Indicate the result of operation. SUCCESS: is success ONGOING: is open in progress FAIL: is failure Error Code:902 pdp already active Indicate the current network state |
|  | 0: network close (deactivated) 1: network open(activated)  |

#### 10.3 AT+NETCLOSE Close network

This command is used to closes network.

| Read Command AT+NETCLOSE?     | Response OK ERROR                  |
|-------------------------------|------------------------------------|
| Execution Command AT+NETCLOSE | Response OK +NETCLOSE: <err></err> |
| Test Command AT+NETCLOSE=?    | Response OK                        |

| Parameters  | Description   |
|-------------|---|
| <err></err> | Indicate the result of operation. SUCCESS: is success ONGOING: is open in progress FAIL: is failure |

### 10.4 AT+CIPOPEN Establish Connection in Multi-socket Mode

This command is used to establish a connection with TCP server and UDP server, The sum of all connections is 6.

| Test Command AT+CIPOPEN=?   | Response +CIPOPEN: (list of supported <link_num>s), (list of supported <type>s) OK</type></link_num>                                  |
|---|---|
| Read Command AT+CIPOPEN?  | Response +CIPOPEN: <link_num>[,<type>,<serverip>, <serverport>,<index>] OK Or ERROR</index></serverport></serverip></type></link_num> |
| Write Command   | Response  |
| AT+CIPOPEN=   | OK  |
| <li><li>k_num&gt;,<type>,<ser< li=""></ser<></type></li></li>     | +CIPOPEN: <err>,<link_num></link_num></err>   |
| verIP>, <serverport>[,<lo< td=""><td>&gt;</td></lo<></serverport> | >   |
| calPort>]   | OK  |
|   | ERROR   |

| Reference Note |  |
|----------------|--|
|----------------|--|

| Parameters                     | Description  |
|--------------------------------|--|
| <li><li>link_num&gt;</li></li> | Identifies a connection , from 0 to 5, and default value is 0.  If AT+CIPMODE= <mode> is set, the <li>link_num&gt; is restricted to be only 0, +++ is exit send and receive mode.</li></mode>  |
| <type></type>                  | Identifies the type of transmission protocol.  TCP: Transfer Control Protocol  UDP: User Datagram Protocol   |
| <serverip></serverip>          | Identifies the IP address of server.  If type is UDP serverIP set to empty,except AT+CIPMODE=1.  |
| <serverport></serverport>      | Identifies the port ofserver, from 0 to 65535, and default value is 0.  If type is UDP serverPort set to empty, except AT+CIPMODE=1.   |
| <localport></localport>        | Identifies the port of local socket, from 0 to 65535, and default value is 0.  |
| <err></err>                    | Indicate the result of operation.  SUCCESS: is success  FAIL: is failure  if AT+CIPMODE=1:  >: connect establish and can be send or receive data.  OK: exit online data send and receive mode. |

# 10.5 AT+CIPSEND Send Data Through TCP or UDP Connection

This command is used to send data through TCP or UDP connection on non\_transparent mode

| Test Command | Response   |
|--------------|--|
| AT+CIPSEND=? | +CIPSEND: (list of supported <link_num>s), (list of</link_num> |
|              | supported <length>s)</length>                                  |
|              | ОК   |
| Read Command | Response   |
| AT+CIPSEND?  | OK   |
|              | Or   |
|              | ERROR  |
|              |  |

| Write Command             | Response   |
|---------------------------|--|
| AT+CIPSEND=               | OK   |
| <li>link_num&gt;,</li>    | +CIPSEND:  |
| [ <length>]</length>      | <pre><err>,<link_num>,<reqsendlength>,<cnfsendlength></cnfsendlength></reqsendlength></link_num></err></pre> |
|                           | ERROR  |
| AT+CIPSEND=               |  |
| <li>link_num&gt;,,,,</li> | This command is used to send data to remote side on  |
| <data></data>             | non_transparent mode.  |
|                           | Single <ctrl+z>is start send.</ctrl+z>   |
| AT+CIPSEND=               | Single <esc> is used to cancel the sending.</esc>  |
| <li>link_num&gt;,</li>    | Single <ctrl+d>means exit the sending mode.</ctrl+d>   |
| [ <length>],</length>     | <ctrl+z> is 0x1A, <esc> is 0x1B, <ctrl+d> is x04.</ctrl+d></esc></ctrl+z>                                    |
| <serverip>,</serverip>    | These signals take effect when no length is specified  |
| <serverport></serverport> | Note   |
| (This format is for       | 1.In transparent mode <length> will be ignore or the</length>  |
| UDP connect)              | <length> is empty, when input data length reach to 1500</length>   |
|                           | will trigger send out.   |
|                           | 2.Small data can be sent as follows:   |
|                           | TCP type: AT+CIPSEND= <link_num>,,,,<data></data></link_num>   |
|                           | UDP type:  |
|                           | AT+CIPSEND= <link_num>,,<serverip>,<serverport>,<data></data></serverport></serverip></link_num>             |

| Parameters                      | Description  |
|---------------------------------|--|
| <li><li>link_num&gt;</li></li>  | Identifies a connection , from 0 to 5, and default value is 0.   |
| <length></length>               | Indicates the length of sending data, from 1 to 1500, and default value is 0.  TCP: Transfer Control Protocol  UDP: User Datagram Protocol  Identifies the IP address of server. The IP address format consists of 4 octets, separated by decimal point: "AAA.BBB.CCC.DDD" |
| <serverport></serverport>       | Identifies the port of UDP server, from 0 to 65535, and default value is 0.  |
| <data></data>                   | Identifies the contents for sending,and The maximum length is 512  |
| <reqsendlength></reqsendlength> | a numeric parameter that requested number of data bytes to be transmitted.   |
| <cnfsendlength></cnfsendlength> | a numeric parameter that confirmed number of data bytes to be transmitted.  PS: When set to hexadecimal by the MCIPCFGPL, <cnfsendlength>=<reqsendlength>/2.</reqsendlength></cnfsendlength>   |

| <err></err> | Indicate the result of operation.    |
|-------------|--------------------------------------|
|             | SUCCESS: is success FAIL: is failure |

## 10.6 AT+CIPRXGET Get the Network Data Manually

This command is used to Get the Network Data Manually

| This command is accase to contine Notwork Bata Manaday              |   |
|---|---|
| Test Command AT+CIPRXGET=?  | Response +CIPRXGET: (list of supported <mode>s), (list of supported <cid>s), (list of supported <len>s) OK</len></cid></mode>                 |
| Read Command AT+CIPRXGET?   | Response +CIPRXGET: <link0_mode>,<link9_mode> OK Or ERROR</link9_mode></link0_mode>   |
| Write Command AT+CIPRXGET= <mode>, <cid>[,<len>]</len></cid></mode> | <pre>Response <mode> = 2: +CIPRXGET:SUCCESS,<mode>,<cid>,<read_len>,<re data="" len="" maining="">,</re></read_len></cid></mode></mode></pre> |
|   | ERROR   |

| Parameters            | Description   |
|-----------------------|---|
| <mode></mode>         | Indicate how to get the network data, from 0 to 4, and default value is 0.  0: set the way to get the network data automatically.  1: set the way to get the network data manually.  2: read data, the max read length is 1500.  3: read data in HEX form, the max read length is 750.  4: get the rest data length |
| <cid></cid>           | Identifies a connection, from 0 to 5, and default value is 0.   |
| <len></len>           | The data length to be read.   |
| <read_len></read_len> | The length of the data that have read.  |

| <remaining data<="" th=""><th>The length of remaining data.</th></remaining> | The length of remaining data.  |
|--|--|
| len>   |  |
| <data></data>  | The read data.   |
| <err></err>  | Indicate the result of operation.  SUCCESS: is success  FAIL: is failure |

#### 10.7 AT+CIPCLOSE Close TCP or UDP Socket Connection

This command is used to Close TCP or UDP Socket

| Test Command                                      | Response  |
|---|---|
| AT+CIPCLOSE=?                                     | +CIPCLOSE: (list of supported <link_num>s)</link_num> |
|   | OK  |
|   |   |
| Write Command                                     | Response  |
| AT+CIPCLOSE= <link_n< td=""><td>OK</td></link_n<> | OK  |
| um>   | +CIPCLOSE: <err>,<link_num></link_num></err>          |
|   | or  |
|   | ERROR   |
|   |   |
| Read Command                                      | Response  |
|   |   |
| AT+CIPCLOSE?                                      | +CIPCLOSE: <link_num>,<status></status></link_num>    |
|   | OK  |

Parameters are defined below:

| Parameters                     | Description  |
|--------------------------------|--|
| <li><li>link_num&gt;</li></li> | Identifies a connection .from 0 to 5, and default value is 0. Indicate the result of operation. SUCCESS: is success FAIL: is failure |
| <status></status>              | 0: disconnect<br>1: connected  |

### 10.8 AT+CIPMODE Select TCP/IP Application Mode

This command is used to select transparent mode (data mode) or non-transparent mode (command mode ) before network open.

| Execution Command AT+CIPMODE            | Response  OK  Execute command will set the parameter to default value.                    |
|---|---|
| Write Command AT+CIPMODE= <mode></mode> | Response OK Or ERROR  |
| Read Command AT+CIPMODE?                | Response +CIPMODE: <mode> OK</mode>   |
| Test Command AT+CIPMODE=?               | Response +CIPMODE: (list of supported <mode>s) OK</mode>                                  |
| Reference                               | Note when set to transparent mode, the ACK and HEX set by MCIPCFGPL will not take effect. |

| Parameters    | Description   |
|---------------|---|
| <mode></mode> | Indicates to select transparent mode or non-transparent mode. from 0 to 1, and default value is 0. 0: non-transparent mode 1: transparent mode(similar to the data entry pattern) |

# 10.9 AT+MCIPCFGPL Configure parameters of TCP/IP

This command is used to configure parameters of socket.

| Test Command   | Response  |
|----------------|---|
| AT+MCIPCFGPL=? | +MCIPCFGPL:(list of supported <link_num>s), (list of</link_num>                 |
|                | supported <hex_support>s),(list of supported</hex_support>                      |
|                | <ack_support>s), (list of supported <ssl_support>s,</ssl_support></ack_support> |
|                | (list of supported <ignore_cert>s)</ignore_cert>                                |
|                | OK  |

| Write Command   | Response  |
|---|---|
| AT+MCIPCFGPL= <link_< th=""><th>OK or ERROR</th></link_<>   | OK or ERROR   |
| num>,[[ <hex_support>],</hex_support>   |   |
| [ <ack_support>],[<ssl_s< th=""><th>Ps. If would like to change hex/ack/ssl/ support. all scokets</th></ssl_s<></ack_support> | Ps. If would like to change hex/ack/ssl/ support. all scokets   |
| upport>],[ <ignore_cert< th=""><th>must be disconnected before</th></ignore_cert<>  | must be disconnected before   |
| >]]   |   |
|   |   |
| Read Command  | Response  |
| AT+MCIPCFGPL?   | +MCIPCFGPL:   |
|   | ( <hex_support>,<ack_support>,<ssl_support>,<ignore< th=""></ignore<></ssl_support></ack_support></hex_support> |
|   | _cert>),  |
|   | OK  |

| Parameters                  | Description   |
|-----------------------------|---|
| <li><li>num&gt;</li></li>   | Identifies a connection. The range of permitted values is 0 to 5.   |
| <hex_support></hex_support> | Indicates the form of sending data, 0 - normal,1 – HEX.   |
| <ack_support></ack_support> | Indicates the form of sending ACK, default ACKfunction is not supported. 0 – not wait for server ACK,1 – need to wait for server ACK  |
| <ssl_support></ssl_support> | Indicates used to set the SSL function for TCP connection only, maximum support three SSL TCP connections, and default SSL function is not supported. 0: Not support SSL,1: Support SSL |
| <ignore_cert></ignore_cert> | Indicates whether the SSL connection ignores the certificate,and default is 0.  0 - ignores certificate  1 - use certificate  |

# 10.10 AT+MCIPCFG Configure parameters of TCP/IP

### Configure parameters of TCP/IP

| Test Command | Response   |
|--------------|--|
| AT+MCIPCFG=? | +MCIPCFG: (list of supported <heartbeat_time>s)</heartbeat_time> |
|              | OK   |
|              |  |

| Write Command                     | Response  |
|-----------------------------------|---|
| AT+MCIPCFG=                       | OK or ERROR   |
| <heartbeat_time></heartbeat_time> | Ps.If need to read/write value of heartbeat/delay time, all |
|                                   | scokets must be disconnected before.                        |
| Read Command                      |   |
| AT+MCIPCFG?                       | Response  |
|                                   | +MCIPCFG: <heartbeat_time></heartbeat_time>                 |
|                                   | OK  |

| Parameters                        | Description  |
|-----------------------------------|--|
| <heartbeat_time></heartbeat_time> | Indicates keepalive time,the time depends on the network(test eg:GSMcan not exceed 10min . It takes at least about 12 minutes to recognize that TCP has been disconnected.).  Range:0-7200 sencod, and default value is 0 sencod .  Ps. When heartbeat_time set to 0, the function of keepalive will be closed |

# 10.11AT+MPING Ping destination address

Ping destination address .

| J  |   |
|--|---|
| Write Command  | Response  |
| AT+MPING= <dest_addr< td=""><td>OK</td></dest_addr<>   | OK  |
| >, <dest_ad dr_type=""></dest_ad>  | If ping'sresult_type= 1   |

|  | ,(1-100),(32-256),(1-255)   |
|  | OK  |
|  |   |

| Parameters | Description |
|------------|-------------|
|            |             |

| <dest_addr></dest_addr>               | The destination is to be pinged; it can be an IP address or a domain name.  |
|---------------------------------------|---|
| <dest_addr_type></dest_addr_type>     | Integer type. Address family type of the destination address 1 – IPv4. 2 – IPv6(reserved)   |
| <num_pings></num_pings>               | Integer type. The num_pings specifies the number of times the ping request (1-100) is to be sent. The default value is 4.                     |
| <data_packet_size></data_packet_size> | Integer type. Data byte size of the ping packet (32-256). The default value is 32 bytes.  |
| <wait_time></wait_time>               | Integer type. Wait time for ping response. An ping response received after the timeout shall not be processed(1-255). The default value is 3. |
| <result_type></result_type>           | <ul><li>1 – Ping success</li><li>2 – Ping time out</li><li>3 – Ping result</li></ul>  |
| <num_pkts_sent></num_pkts_sent>       | Indicates the number of ping requests that were sent out.   |
| <num_pkts_recvd></num_pkts_recvd>     | Indicates the number of ping responses that were received.  |
| <num_pkts_lost></num_pkts_lost>       | Indicates the number of ping requests for which no response was received.   |
| <min_rtt></min_rtt>                   | Indicates the minimum Round Trip Time(RTT).   |
| <max_rtt></max_rtt>                   | Indicates the maximum RTT.  |
| <avg_rtt></avg_rtt>                   | Indicates the average RTT.  |
| <resolved_ip_addr></resolved_ip_addr> | Indicates the resolved ip address.  |
| < rtt>                                | Round Trip Time.  |
| <ttl></ttl>                           | Time-To-Live  |

# 10.12AT+MPINGSTOP Stop an ongoing ping session

Stop an ongoing ping session.

| <b>Execution Command</b> | Response   |
|--------------------------|--|
| AT+MPINGSTOP             | OK   |
|                          | +MPING:  |

|                |          |
|                |          |
|                |          |

#### 10.13AT+IPADDR Inquire Socket PDP Address

This command inquires the IP address of current active socket PDP Before calling this command, AT+NETOPEN have been execute first.

| Execution Command AT+IPADDR | Response +IPADDR: <err>,<ip_address> OK ERROR</ip_address></err> |
|-----------------------------|--|
| Read Command AT+IPADDR?     | Response<br>OK<br>ERROR  |

#### Parameters are defined below:

| Parameters                | Description  |
|---------------------------|--|
| <err></err>               | Indicate the result of operation. SUCCESS: is success FAIL: is failure |
| <ip_address></ip_address> | This command inquires the IP address of current active socket PDP      |

### 10.14 AT+SERVERSTART Startup TCP Server

This command starts up TCP server, and the server can receive the request of TCP client. After the command executes successfully, an unsolicited result code is returned when a client tries to connect with module and module accepts request. The unsolicited result code is +CLIENT: < link\_num >,<client\_IP>:<port>...

| Test Comr | nand      | Response                            |
|-----------|-----------|-------------------------------------|
| AT+SERV   | ERSTART=? | +SERVERSTART: (1-65535),(1-6),(0-1) |
|           |           | OK                                  |
|           |           |                                     |

| Read Command AT+SERVERSTART?   | Response +SERVERSTART: <port>,&lt; backlog &gt;,<iptype> OK</iptype></port> |
|--|---|
| Write Command AT+SERVERSTART= < port>, < backlog>, <iptype></iptype> | Response OK +SERVERSTART: <err> ERROR</err>                                 |

| Parameters        | Description  |
|-------------------|--|
| <port></port>     | The server port, from 1 to 65535.                                      |
| < backlog >       | The maximum connections can be queued in listen queue, from 1 to 6.    |
| <iptype></iptype> | 0:IPV4<br>1:IPV6   |
| <err></err>       | Indicate the result of operation. SUCCESS: is success FAIL: is failure |

# 10.15 AT+SERVERSTOP Stop TCP Server

This command stops TCP server.

| Execution Command | Response                 |
|-------------------|--------------------------|
| AT+SERVERSTOP     | OK                       |
|                   | +SERVERSTOP: <err></err> |
|                   | ERROR                    |
| Test Command      | Response                 |
| AT+SERVERSTOP=?   | OK                       |
|                   |                          |
|                   |                          |

| Parameters  | Description  |
|-------------|--|
| <err></err> | Indicate the result of operation. SUCCESS: is success FAIL: is failure |

### 10.16 AT+MDNSGIP Query the IP address of given domain name

Query the IP address of given domain name.

| •   |  |
|---|--|
| Write Command   | Response   |
| AT+MDNSGIP= <domain< td=""><td>If successful,return:</td></domain<> | If successful,return:                                    |
| name>   | +MDNSGIP: <domain name="">,<ip address=""></ip></domain> |
|   | OK   |
|   | If fail,return:  |
|   | ERROR  |
| Test Command  | Response   |
| AT+MDNSGIP=?  | +MDNSGIP:"domain name"                                   |
|   | ОК   |
|   |  |
| Read Command  | Response   |
| AT+MDNSGIP?   | OK   |
|   |  |
|   |  |

#### Parameters are defined below:

| Parameters                | Description  |
|---------------------------|--|
| <domain name=""></domain> | A string parameter (string should be included in quotation marks) which indicates the do ma-in name.                               |
| <ip address=""></ip>      | A string parameter (string should be included in quotation marks) which indicates the IP address corresponding to the domain name. |

### 10.17 AT+USEDDATA Statistics of current data traffic

This command is used to get currently used all data traffic.

| Action Command | Response                         |
|----------------|----------------------------------|
| AT+USEDDATA    | +USEDDATA: <useddata></useddata> |
|                | OK                               |
|                |                                  |

| <useddata></useddata> | A interger parameter,represents the total data traffic consumed, in |
|-----------------------|---|
|                       | bytes.  |

#### 10.18 AT+CLEARDATA Reset data traffic statistics

This command is used to clear data traffic statistics.

| Action Command | Response |
|----------------|----------|
| AT+CLEARDATA   | OK       |
|                |          |
|                |          |

### 10.19 AT+NETDNS Setting DNS configuration

This command is used to set dns

| Write Command                  | Response                             |
|--------------------------------|--------------------------------------|
| AT+NETDNS= <dns1>[,&lt;</dns1> | If success,return:                   |
| dns2>]                         | OK                                   |
|                                | If fail,return:                      |
|                                | ERROR                                |
| Read Command                   | Response                             |
| AT+NETDNS?                     | +NETDNS: <dns1>,<dns2></dns2></dns1> |
|                                | OK                                   |
|                                |                                      |
| Test Command                   | Response                             |
| AT+NETDNS=?                    | +NETDNS: <dns1>,<dns2></dns2></dns1> |
|                                | OK                                   |
|                                |                                      |
|                                |                                      |

Parameters are defined below:

| Parameters    | Description     |
|---------------|-----------------|
| <dns1></dns1> | Dns1 address IP |
| <dns2></dns2> | Dns2 address IP |

### 10.20 AT+CIPOPQUERY Inquire the Specific Link Connect Status

This command is used to inquire the specific link connect status.

| Write Command AT+CIPOPQUERY= <link _num=""/> ,[ <link_num>,]</link_num> | Response +CIPOPQUERY: <link_num_state>[,···,<link_n_state>] OK Or ERROR</link_n_state></link_num_state> |
|---|---|
| Read Command AT+CIPOPQUERY?   | Response +CIPOPQUERY: (list of link_num <state>s) OK</state>  |
| Test Command AT+CIPOPQUERY=?  | Response<br>+CIPOPQUERY:(0-5),(0-5),(0-5),(0-5),(0-5)<br>OK   |

| Parameters                 | Description   |
|----------------------------|---|
| <li><li>num &gt;</li></li> | Identifies a connection. The range of permitted values is 0 to 5. |
| <state></state>            | 0:disconnected<br>1:connected                                     |

# **11.HTTP AT Commands**

### 11.1 AT\$HTTPOPEN Open HTTP Service

The command is used to open HTTP service

| Execution Command | Response   |
|-------------------|--|
| AT\$HTTPOPEN      | OK   |
|                   | The command is used to open HTTP service. To use       |
|                   | HTTP, you must execute the command in the first.In the |
|                   | last, execute \$HTTPCLOSE to close HTTP service.       |
|                   |  |
| Read Command      | Response   |
| AT\$HTTPOPEN?     | \$HTTPOPEN: <opened_or_not></opened_or_not>            |
|                   | OK   |
|                   | Return HTTP service is opened or not.                  |
|                   | 1: HTTP service is opened.                             |
|                   | 0: HTTP service is not opened.                         |

# 11.2 AT\$HTTPCLOSE Close HTTP Service

The command is used to close http service

| Execution Command | Response  |
|-------------------|---|
| AT\$HTTPCLOSE     | OK  |
|                   | The command is used to close HTTP service. After    |
|                   | executing this command, HTTP will be closed after 1 |
|                   | minute and the http will be unavailable.            |
| Read Command      | Response  |
| AT\$HTTPCLOSE?    | \$HTTPCLOSE: <closed_or_not></closed_or_not>        |
|                   | OK  |
|                   | Return HTTP service is closed or not.               |
|                   | 1: HTTP service is closed.                          |
|                   | 0: HTTP service is not closed.                      |

### 11.3 AT\$HTTPPARA Set HTTP Request URL And Port

The command is used to Set HTTP Request URL And Port

| Write Command AT\$HTTPPARA= <url>,&lt; port&gt;[,<type>][,<cert>]</cert></type></url> | Response OK or ERROR   |
|---|--|
| Test Command AT\$HTTPPARA=?   | Response<br>\$HTTPPARA="",(0-65535),(0-1), (0-1)<br>OK   |
| Read Command AT\$HTTPPARA?  | Response Return current HTTP request's host,uri,and port,such as: AT\$HTTPPARA? Host: "182.150.28.206" URI: "/httpdemo/http" Port: 8182. Cert: 1 |

Parameters are defined below:

| Parameters    | Description   |
|---------------|---|
| <url></url>   | <pre><mandatory parameter=""> 0-255 HTTP client URL:"http://server'/path':'tcpPort</mandatory></pre>                          |
| <port></port> | The HTTP request's port. The HTTP default port is 80, and HTTPS is 443.   |
| <type></type> | HTTP request type.Default is HTTP.  0: HTTP request  1: HTTPS request   |
| <cert></cert> | Indicates whether the SSL connection ignores the certificate, and default is 0.  0 - ignores certificate  1 - use certificate |

### 11.4 AT\$HTTPACTION Send HTTP Request

The command is used to send HTTP Request.Support request include GET,POST and HEAD.

Write Command

AT\$HTTPACTION=<req uest>

Response

\$HTTPRECV:DATA,<len>

. . . . . .

\$HTTPRECV:DATA,2

<\r><\n>

\$HTTPRECV:DATA,<len>

or

\$HTTPERROR:<errno>

**ERROR** 

This command will return HTTP response header fields and file path which storage HTML text or download file if request success. If request fail ,this command just return response header fields. Specially, the HEAD request only return response header fields. For POST,must set Conten-Length header item and POST's content data. Note

If a 202 error code appears and the request fails, execute the AT\$HTTPOPEN instruction after the AT\$HTTPCLOSE command.

Test Command

Response

AT\$HTTPACTION=?

\$HTTPACTION:(0-3)

oĸ

Parameters are defined below:

Parameters

Description

In the property of th

### 11.5 AT\$HTTPDATA Set HTTP Post Request's Data

This command is used to set http post request's data

| Write Command   | Response  |
|---|---|
| AT\$HTTPDATA= <data< th=""><th>The command is used to set HTTP post request's content.</th></data<> | The command is used to set HTTP post request's content. |
| _len>   | This command is effective only to POST.                 |
|   |   |

| Test Command   | Response                          |
|----------------|-----------------------------------|
| AT\$HTTPDATA=? | \$HTTPDATA:(0-1024)               |
|                | OK                                |
|                |                                   |
| Read Command   | Response                          |
| AT\$HTTPDATA?  | \$HTTPDATA: <data_len></data_len> |
|                | ОК                                |
|                |                                   |

| Parameters            | Description   |
|-----------------------|---|
| <data_len></data_len> | The post request's content length. The length is between 0 and 1024.  0 mean data write end. When data length reach <data_len>,it's auto exit inputing. After this, must use \$HTTPSEND to send data every time.</data_len> |

#### 11.6 AT\$HTTPSEND Send HTTP Post Content Data

This command is used to Send HTTP Post Content Data

| Execute Command | Response  |
|-----------------|---|
| AT\$HTTPSEND    | The command is used to send HTTP post request's         |
|                 | content. This command effective only to POST.After data |
|                 | send complete, will receive response.                   |
|                 | ОК  |
|                 |   |

### 11.7AT\$HTTPDATAEX Set HTTP Post Request's Data

This command is used to Set HTTP Post Request's Data

| Write Command                                  | Response                 |
|--|--------------------------|
| AT\$HTTPDATAEX= <dat< th=""><th>OK</th></dat<> | OK                       |
| a_len>, <data></data>                          | or                       |
|  | ERROR                    |
| Test Command                                   | Response                 |
| AT\$HTTPDATAEX=?                               | \$HTTPDATAEX:(0-500) ,"" |
|  | OK                       |
|  |                          |
|  |                          |

| Read Command    | Response                            |
|-----------------|-------------------------------------|
| AT\$HTTPDATAEX? | \$HTTPDATAEX: <data_len></data_len> |
|                 | OK                                  |
|                 |                                     |

| Parameters            | Description   |
|-----------------------|---|
| <data_len></data_len> | The post request's content length. The length is between 0 and 500. Before this must be set "Content-Length" request head, and must be the same as the value. |
| <data></data>         | The post request's content. The length must be same as the <data_len>.</data_len>   |

### 11.8 AT\$HTTPRQH Set HTTP header fields

### Set HTTP header fields

| Test Command AT\$HTTPRQH=?   | Response \$HTTPRQH="","" OK   |
|--|---|
| Read Command AT\$HTTPRQH?  | Response Return current HTTP request header fields and entity header fields.  |
| Write Command  AT\$HTTPRQH= <param< th=""><th>Response The command is used to set HTTP request header fields</th></param<> | Response The command is used to set HTTP request header fields  |
| Key>, <paramvalue></paramvalue>  | and entity header fields. The common request header: "Host": The server's host.Must be matched with URL,If not set,will get from URL. "Content-Length": The content length which will be send.This only for POST. Refer to: "IETP-RFC 2616" |

| Parameters | Description |
|------------|-------------|
|            |             |

| <paramkey></paramkey>     | HTTP request or entity header field's Key. If there are special characters, please add quotes. The max length is 50. Support parameter: "accept", "accept-charset", "accept-encoding", "accept-language", "au thorization", "expect", "from", "host", "if-match", "if-modified-since", "if-n one-match", "if-range", "if-unmodified-since", "max-forwards", "proxy authorization", "range", "referer", "te", "rser-agent", "allow", "content-encoding", "content-language", "content-length", "content-location", "content-md5", "content-range", "content-type", "expires", "last-modified", "user-agent", "connection" |
|---------------------------|--|
| <paramvalue></paramvalue> | HTTP request or entity header field's Value. If there are special characters, please add quotes. The max length is 255.  |

### 11.9 AT\$HTTPTYPE Set HTTP Receive Content Data Save Location

Set HTTP Recv Content Data Save In Local File Or Output To Te.

| Write Command AT\$HTTPTYPE= <type></type> | Response <b>OK</b>        |
|---|---------------------------|
| Test Command                              | Response                  |
| AT\$HTTPTYPE=?                            | \$HTTPTYPE:(0-1)          |
|   | OK                        |
| Read Command                              |                           |
| AT\$HTTPTYPE?                             | Response                  |
|   | \$HTTPTYPE: <type></type> |
|   | OK                        |
|   |                           |

#### Parameters are defined below:

| Parameters    | Description  |
|---------------|--|
| <type></type> | HTTP recv data set save the way,available data include 0,1 0:data output to Te. 1:data save to efs. Note:set value after open HTTP service,and set value before AT\$HTTPACTION.Its default value is 0. |

#### 11.10 AT\$HTTPREAD Read Content Data from Local File.

This command is used to read file content from local file.but AT\$HTTPTYPE=1 effective.

| Test Command   | Response  |
|--|---|
| AT\$HTTPREAD=?   | \$HTTPREAD:(0-1),(0-512000)                                       |
|  | OK  |
| Read Command   | Response  |
| AT\$HTTPREAD?  | \$HTTPREAD: <read_type>,<offset></offset></read_type>             |
| ·  | ок  |
|  | Note:when <read_type>=1,<offset> value is 0.</offset></read_type> |
| Write Command  | Response  |
| AT\$HTTPREAD= <read_t< td=""><td>\$HTTPREAD:<offset>,<data_size></data_size></offset></td></read_t<> | \$HTTPREAD: <offset>,<data_size></data_size></offset>             |
| ype>[, <offset>]</offset>  | <data></data>   |
|  | OK  |
|  | Or  |
|  | \$HTTPREAD: <read_type>,<file_size></file_size></read_type>       |
|  | OK  |
|  | Or  |
|  | ERROR   |
|  | Or  |
|  | \$HTTPERROR: <errno></errno>                                      |
|  | ERROR   |

| Parameters              | Description   |
|-------------------------|---|
| <read_type></read_type> | 0 Read File<br>1 File size  |
| <offset></offset>       | Start read file position, The range is from 0 to 512000, its value should less than file size.  Note: when < read_type >= 1, set < offset > value will return error.  when < read_type >= 0, < offset > default value is 0. |
| <data_size></data_size> | Every time the length of the read from local file.lts value is 1024 byte.   |

### 11.11 HTTP Error Code

| <b>Numeric Format</b> | Verbose Format General errors:   |
|-----------------------|--|
| 200                   | Subsystem established and available                                    |
| 201                   | Subsystem establishment in progress.                                   |
| 202                   | Network subsystem unavailable.   |
| 203                   | PPP is closing.  |
| 204                   | Existing net subsystem resources.                                      |
| 205                   | Physlink going dormant.  |
| 300                   | HTTP service is not opened.  |
| 301                   | HTTP service has opened.   |
| 302                   | URL resolve fail.  |
| 303                   | DNS error.   |
| 304                   | Action error.  |
| 305                   | Request timeout.   |
| 306                   | Downloading file   |
| 307                   | URL not set.   |
| 308                   | Header fields's number exceeds the limit.                              |
| 309                   | Header fields error, such as not set "Content-Length" for POST request |
| 310                   | Header response error(Exception).                                      |
| 311                   | Is sending post data.  |
| 312                   | Post request not started, only for \$HTTPACTION=1                      |
| 313                   | The value of "Content-Length" not same as the content's length.        |
| 314                   | Request fail and should close socket.                                  |
| 315                   | Connection to server failed  |
| 316                   | EFS not enough space   |
| 317                   | EFS operation failed   |
| 350                   | Unknown HTTP error   |

# **12.FTP AT Commands**

#### 12.1 AT+CFTPPORT Set FTP Server Port

This command is used to set ftp server port

Write Command Response AT+CFTPPORT=<port> OK or **ERROR Test Command** Response AT+CFTPPORT=? +CFTPPORT: (list of supported <port>s) OK or **ERROR** Read Command Response AT+CFTPPORT? +CFTPPORT: <port> OK

Parameters are defined below:

Parameters

Description

The FTP server port, from 1 to 65535, and default value is 21.

Example:

AT Command

Response

AT+CFTPPORT=21

OK

#### 12.2 AT+CFTPUN Set User Name for FTP Access

| Write Command AT+CFTPUN=" <name>"</name> | Response This command is used to set user name for FTP server access.  OK |
|--|---|
|  | Note: A single input no more than 1535 bytes                              |
| Read Command AT+CFTPUN?                  | Response +CFTPUN: " <name>" OK</name>                                     |
| Test Command AT+CFTPUN=?                 | Response<br>OK  |

Parameters are defined below:

| Parameters    | Description   |
|---------------|---|
| <name></name> | The user name for FTP server access. The maximum length is 30 |

### 12.3 AT+CFTPPW Set User Password for FTP Access

This command is used to Set User Password for FTP Access

| Write Command                                    | Response                           |
|--|------------------------------------|
| AT+CFTPPW=" <passwo< th=""><th>OK</th></passwo<> | OK                                 |
| rd>"   | or                                 |
|  | ERROR                              |
| Test Command                                     | Response                           |
| AT+CFTPPW=?                                      | ОК                                 |
| Read Command                                     | Response                           |
| AT+CFTPPW?                                       | + CFTPPW: " <password>"</password> |
|  | OK                                 |
|  |                                    |

| Parameters | Description |
|------------|-------------|
|            |             |

| <password></password> | The user password for FTP server access. The maximum length is 40. |
|-----------------------|--|
| Example:              |  |
| AT Command            | Response   |
| AT+CFTPPW="myp ass"   | OK   |
| AT+CFTPPW?            | +CFTPPW: "mypass" OK   |

# 12.4 AT+CFTPTLS Set FTP Security Mode

#### Set FTP Security Mode

| Write Command               | Response                                       |
|-----------------------------|--|
| AT+CFTPTLS= <mode>[,</mode> | This command is used to set FTP Security Mode. |
| <cert>]</cert>              | OK   |
|                             | or   |
|                             | ERROR  |
| Test Command                | Response                                       |
| AT+CFTPTLS=?                | +CFTPTLS: (0-2),(0-1)                          |
|                             | OK   |
|                             |  |
| Read Command                | Response                                       |
| AT+CFTPTLS?                 | +CFTPTLS: < mode>, <cert></cert>               |
|                             | OK   |
|                             |  |

| Parameters    | Description  |
|---------------|--|
| <mode></mode> | Default is 0.When mode is non 0, FTP will over TLS use SSL.  0 - None  1 - Implict  2 - Explicit |
| <cert></cert> | Whether to ignore a certificate, Default is 0 0 - Ignore 1 - Don't ignore                        |
| Example:      |  |

| AT Command      | Response |
|-----------------|----------|
| AT+ CFTPTLS=2,0 | ОК       |

| AT+ CFTPTLS?  | + CFTPTLS:2,0         |
|---------------|-----------------------|
|               | OK                    |
| AT+ CFTPTLS=? | +CFTPTLS: (0-2),(0-1) |
|               | OK                    |

# 12.5 AT+CFTPTYPE Set FTP Type

This command is used to Set FTP Type

| Write Command              | Response  |
|----------------------------|---|
| AT+CFTPTYPE= <type></type> | This command is used to set FTP type. Default is binary |
|                            | type.   |
|                            | ОК  |
|                            | or  |
|                            | ERROR   |
| Test Command               | Response  |
| AT+CFTPTYPE=?              | +CFTPTYPE: (list of supported <type>s)</type>           |
|                            | OK  |
|                            |   |
| Read Command               | Response  |
| AT+CFTPTYPE?               | +CFTPTYPE: <type></type>                                |
|                            | OK  |
|                            |   |

| Parameters      | Description                     |
|-----------------|---------------------------------|
| <type></type>   | I – binary type. A – ASCII type |
| Example:        |                                 |
| AT Command      | Response                        |
| AT+CFTPTYPE="A" | ок                              |
| AT+CFTPTYPE="I" | ОК                              |
| AT+CFTPTYPE?    | +CFTPTYPE: "I" OK               |
| AT+CFTPTYPE=?   | +CFTPTYPE: ("I","A") OK         |

### 12.6 AT+CFTPGETFILE Get a File from FTP Server to EFS

This command is used to Get a File from FTP Server to EFS

| Write Command  | Response                                 |
|--|--|
| AT+CFTPGETFILE=  | OK                                       |
| " <remote_path>","</remote_path>                                 | +CFTPGETFILE: SUCCESS, <length></length> |
| <local_path>"[,<rest_si< td=""><td></td></rest_si<></local_path> |  |
| ze>]   | or                                       |
|  |  |
|  | +CFTPGETFILE: FAIL, <err></err>          |
|  | ERROR                                    |
| Test Command   | Response                                 |
| AT+CFTPGETFILE=?   | +CFTPGETFILE: ,,(0-2147483647)           |
|  | ОК                                       |
|  |  |
| Read Command   | Response                                 |
| AT+CFTPGETFILE?  | +CFTPGETFILE:"remote_path",              |
|  | "local_path", <rest_size></rest_size>    |
|  | ОК                                       |
|  | "local_path" , <rest_size></rest_size>   |

| Parameters                  | Description  |
|-----------------------------|--|
| <remote_path></remote_path> | The remote file path. The maximum length is 512.  If the directory contains non-ASCII characters, the <remote_path> parameter should contain a prefix of {non-ascii}.</remote_path>      |
| <local_path></local_path>   | The efs file path. The maximum length is 512.  Local file name string notsopport non-ascii and cannot contain:  /\:, *?"><   Note: local_path root directory"/" is default"C: / " in EFS |
| <rest_size></rest_size>     | The value for FTP "REST" command which is used for broken transfer when transferring failed last time. The range is from 0 to 2147483647.  |
| <length></length>           | The size of the download file  |
| Example:                    |  |
| AT Command                  | Response   |

AT+CFTPGETFILE=

"/test/CXL/abc.txt",

"/mydir/test1.txt"

+CFTPGETFILE: SUCCESS,10245

AT+CFTPGETFILE= "/test/CXL/abc.txt", "/mydir/test1.txt",10

| 214        | Network error                    |
| 215        | Failed to connect socket         |
|            |                                  |

| 216 | Failed to send data using socket        |
|-----|---|
| 217 | Failed to receive data using socket     |
| 218 | Failed to verify user name and password |
| 219 | Socket connect timeout                  |
| 220 | File does not exist                     |

# 13.MQTT AT Commands

# 13.1 AT+MCONFIGRelated Parameters Configuration for MQTT

This command is used to set parameters configuration

| Test Command AT+MCONFIG=?  | Response<br>+MCONFIG: ,,,(0-1),(0-2),(0-1),,<br>OK   |
|--|--|
| Write Command  AT+MCONFIG= <clientid>[, <username>],[<password>][,&lt; will_flag&gt;,<will_qos>,<will_ retain="">,<will_topic>,<will_ message="">]]</will_></will_topic></will_></will_qos></password></username></clientid> | Response OK Or ERROR   |
| Read Command AT+MCONFIG?   | Response +MCONFIG: <clientid>[,<username>,<password> [,<will_flag>,<will_qos>,<will_retain>,<will_topic>,<will_message>]] OK</will_message></will_topic></will_retain></will_qos></will_flag></password></username></clientid> |
| Reference  | Note This command you should send before "AT+MIPCONFIG" cmmand.If the server is not a user name and password, please do not enter the user name and password, otherwise will logon failure.                                    |

| Parameters                                   | Description   |
|--|---|
| <cli><cli><cli><cli></cli></cli></cli></cli> | This parameter is used to allow the server to identify the client identity information. The maximum length of 256 |
| <username></username>                        | This parameter is used to login server. The maximum length of 256   |
| <password></password>                        | This parameter is used to login server. The maximum length of 256   |

| <will_flag></will_flag>       | Value of will flag:  1 If the Will flag is set 1, the Will QoS and Will Retain fields must be present in the Connect flags byte, and the Will Topic and Will Message fields must be present in the payload.  0 Without using will Qos, will retain, will topic, will message, please set 0. |
|-------------------------------|---|
| <will_qos></will_qos>         | Quality of Service:  0 At most once delivery for will message  1 At least once delivery for will message  2 Exactly once delivery for will message  |
| <will_retain></will_retain>   | Retain Flag:  0 the Server must not store the will message and must not remove or replace any existing retained message.  1 the Server must store the will Message and its QoS.   |
| <will_topic></will_topic>     | The will topic of the will message. The maximum length is 256.  |
| <will_message></will_message> | The will message content. The maximum length is 1024.   |

# 13.2 AT+MIPSTARTSet address and port and version

Description

| Test Command AT+MIPSTART=?  | Response<br>+MIPSTART:,(0-65535),(3-4)<br>OK                                      |
|---|---|
| Write Command AT+MIPSTART= <address>, <port>[,<version>]</version></port></address> | Response OK +MIPSTART: <result> Or ERROR</result>                                 |
| Read Command AT+MIPSTART?   | Response +MIPSTART: <address>,<port>,<version> OK</version></port></address>      |
| Reference   | Note If server no response, module will return "+CME ERROR: 151" about 30 seconds |
| Parameters are defined below:   |   |

**Parameters** 

| <ipaddress></ipaddress> | The MQTT server domain name or IP address. The maximum length is 256  |
|-------------------------|---|
| <port></port>           | The MQTT Server port. The value is between 0 and 65535, default value is 0.   |
| <version></version>     | The MQTT version. The value is between 3 and 4, default value is 3. 3 stands for mqtt version 3.1, 4 stands for mqtt version 3.1.1. |
| <result></result>       | The result of opening socket operation: SUCCESS FAILURE   |

# 13.3 AT+MCONNECTClient requests Connection to Server

| Test Command AT+MCONNECT=?   | Response<br>+MCONNECT:(0-1), (30-1800)<br>OK                                       |
|--|--|
| Write Command AT+MCONNECT= <clean _session="">,<keepalive></keepalive></clean> | Response OK +MCONNECT: <result> Or ERROR</result>                                  |
| Read Command AT+MCONNECT?  | Response +MCONNECT: <clean_session>,<keepalive> OK</keepalive></clean_session>     |
| Reference  | Note If server no response, module will return "+CME ERROR: 151" about 30 seconds. |

| Parameters | Description |
|------------|-------------|
|            |             |

| <clean_session></clean_session> | This parameter specifies the handling of the Session state.  0 If CleanSession is set to 0, the Server must resume communications with the Client based on state from the current Session (as identified by the Client identifier). If there is no Session associated with the Client identifier the Server must create a new Session. The Client and Server MUST store the Session after the Client and Server are disconnected. After the disconnection of a Session that had CleanSession set to 0, the Server MUST store further QoS 1 and QoS 2 messages that match any subscriptions that the client had at the time of disconnection as part of the Session state. It may also store QoS 0 messages that meet the same criteria.  1 If CleanSession is set to 1, the Client and Server must discard any previous Session and start a new one. This Session lasts as long as the Network Connection. State data associated with this Session must not be reused in any subsequent Session. |
|---------------------------------|--|
| <keepalive></keepalive>         | 30-1800 The Keep Alive is a time interval measured in seconds.   |
| <result></result>               | The result of connectingmqtt server operation: SUCCESS FAILURE   |

# 13.4 AT+MPUBPublish message

This command is used to publish message

| Test Command | Response             |
|--------------|----------------------|
| AT+MPUB=?    | +MPUB: ,(0-2),(0-1), |
|              | ОК                   |
|              |                      |

| Write Command AT+MPUB= <topic>,<qos>,<retain>,<message></message></retain></qos></topic> | Response OK or ERROR There are two kinds of results depending on the Settings: a.AT+MQTTMIX=0 +MPUB: <result> b.AT+MQTTMIX=1 If qos=0, nothing returned; if qos&gt;0, return +MPUBID: <packetid> first,then return as follows: +MPUBACK: <packetid> qos = 1 +MPUBREC: <packetid> qos = 2 +MPUBCOMP:<packetid></packetid></packetid></packetid></packetid></result> |
|--|--|
| Read Command AT+MPUB?  | Response +MPUB: <topic>,<qos>,<retain>,<message> OK</message></retain></qos></topic>   |
| Reference  | Note This command is sent from a Client to a Server or from Server to a Client to transport an Application Message. If server no response, module will return "+CME ERROR: 151" about 30 seconds   |

| Parameters            | Description   |
|-----------------------|---|
| <topic></topic>       | The topic of the Application message. The maximum length is 256   |
| <qos></qos>           | Quality of Service:  0 At most once delivery for Application message  1 At least once delivery for Application message  2 Exactly once delivery for Application message                       |
| <retain></retain>     | Retain Flag:  0 the Server must not store the Application message and must not remove or replace any existing retained message.  1 the Server must store the Application Message and its QoS. |
| <message></message>   | The Application message content. The maximum length of 512  |
| <result></result>     | The result of publishing operation: SUCCESS FAILURE   |
| <packetid></packetid> | The Packet Identifier field (1~65535).  |

# 13.5 AT+MPUBEXPublish a long message

This command is used to publish message

| Test Command AT+MPUBEX=?   | Response<br>+MPUBEX: ,(0-2),(0-1),(1-4096)<br>OK  |
|--|---|
| Write Command AT+MPUBEX= <topic>,<qos>,<retain>,<msglen></msglen></retain></qos></topic> | Response OK Or ERROR There are two kinds of results depending on the Settings: a.AT+MQTTMIX=0 +MPUBEX: <result> b.AT+MQTTMIX=1 If qos=0, nothing returned; if qos&gt;0, return +MPUBID: <packetid> first,then return as follows: +MPUBACK: <packetid> qos = 1 +MPUBREC: <packetid> qos = 2 +MPUBCOMP: <packetid></packetid></packetid></packetid></packetid></result>   |
| Read Command AT+MPUBEX?  | Response<br>+MPUBEX: <topic>,<qos>,<retain>,<msglen><br/>OK</msglen></retain></qos></topic>   |
| Reference  | Note  1.In this mode, data in any format can be sent, such as JSON.  2 Input mode will not sent keepalive, so the input data interval cannot be longer than keepalive, or the connection may be disconnected  3 Input mode should not exceed 4096 bytes at a time.  4 When data length reach <msglen>,it's auto exit inputing.  5 After entering the data mode for more than 10s, it will automatically exit and return ERROR.</msglen> |

| Parameters      | Description   |
|-----------------|---|
| <topic></topic> | The topic of the Application message. The maximum length is 256   |
| <qos></qos>     | Quality of Service:  0 At most once delivery for Application message  1 At least once delivery for Application message  2 Exactly once delivery for Application message |

| <retain></retain>     | Retain Flag:  0 the Server must not store the Application message and must not remove or replace any existing retained message.  1 the Server must store the Application Message and its QoS. |
|-----------------------|---|
| <msglen></msglen>     | The message content length. The maximum length of 4096.   |
| <result></result>     | The result of publishing operation: SUCCESS FAILURE   |
| <packetid></packetid> | The Packet Identifier field (1~65535).  |

# 13.6 AT+MSUB Subscribe to topics

This command is used to Subscribe to topics

| Test Command Respon AT+MSUB=? +MSUB OK                                      | nse<br>3: ,(0-2)   |
|---|--|
| ОК  | ery can only display topics up to the last subscription. |
| a. AT+I +MSUE b. AT+I +MSUE +MSUE This co maximum If has s start to Receive |  |
| TIVISUE   | n riopior, rielle bytes, rillessagee                     |

| Reference | Note   |
|-----------|--|
|           | This command is sent from the Client to the Server to create one or  |
|           | more Subscriptions.  |
|           | If server no response, module will return "+CME ERROR: 151" about 30 |
|           | seconds.   |

| Parameters                          | Description   |
|-------------------------------------|---|
| <topic></topic>                     | The topic of the Application message. The maximum length is 256   |
| <qos></qos>                         | Quality of Service:  0 At most once delivery for Application message  1 At least once delivery for Application message  2 Exactly once delivery for Application message |
| <len></len>                         | The received message size.  |
| <message></message>                 | Message content.Max length is 1024.   |
| <result></result>                   | The result of subscribingtopic operation: SUCCESS FAILURE   |
| <packetid></packetid>               | The Packet Identifier field (1~65535).  |
| Example:                            |   |
| AT Command                          | Response  |
| Subscribe:                          | ОК  |
| AT+MQTTMIX= 0:                      | +MSUB: SUCCESS  |
| AT+MSUB=mo                          |   |
| bilet<br>ek/topic,0                 |   |
| If                                  | ОК  |

### 13.8 AT+MDISCONNECT Close MQTT connection

This command is used to close MQTT connection.

| Execution Command | Response  |
|-------------------|---|
| AT+MDISCONNECT    | OK  |
|                   | +MDISCONNECT: <result></result>                                   |
|                   | Or  |
|                   | Already disconnect  |
|                   | ERROR   |
| Reference         | Note  |
|                   | If server no response, module will return "+CME ERROR: 151" about |
|                   | 30 seconds  |

Parameters are defined below:

| Parameters        | Description                            |
|-------------------|--|
| <result></result> | The result of disconnecting operation: |
|                   | SUCCESS                                |
|                   | FAILURE                                |

# 13.9 AT+MIPCLOSERelease MQTT Resources

This command is used to close TCP connection.

| Execution Command | Response  |
|-------------------|---|
| AT+MIPCLOSE       | OK  |
|                   | +MIPCLOSE: <result></result>                                      |
|                   | Or  |
|                   | ERROR   |
| Reference         | Note  |
|                   | If server no response, module will return "+CME ERROR: 151" about |
|                   | 30 seconds  |

| Parameters        | Description                        |
|-------------------|------------------------------------|
| <result></result> | The result of releasing operation: |
|                   | SUCCESS                            |
|                   | FAILURE                            |

# 13.10 AT+MQTTSTATU Query the MQTT connection status

This command is used to Query the MQTT connection status.

| Execution Command | Response                    |
|-------------------|-----------------------------|
| AT+MQTTSTATU      | +MQTTSTATU: <statu></statu> |
|                   |                             |
|                   | OK                          |
| Reference         | Note                        |

Parameters are defined below:

| Parameters      | Description                          |
|-----------------|--------------------------------------|
| <statu></statu> | 0 MQTT connection is not established |
|                 | 1 The MQTT connection is successful  |

# 13.11 AT+MQTTSSL MQTTSSL support switch

This command is used to Query the MQTT connection status.

| Test Command                     | Response                                    |
|----------------------------------|---|
| AT+MQTTSSL=?                     | +MQTTSSL: (0-1),(0-1)  OK                   |
| Read Command                     | Response                                    |
| AT+MQTTSSL?                      | +MQTTSSL: <action>,<cert></cert></action>   |
| Write Command                    | Response                                    |
| AT+MQTTSSL= <action>[,c</action> | ОК  |
| ert]                             | Or  |
|                                  | ERROR                                       |
| Reference                        | Note  |
|                                  | The command must be used before AT+MIPSTART |

| Parameters | Description |
|------------|-------------|
|            |             |

| <action></action> | The switch for SSL support.     |  |
|-------------------|---------------------------------|--|
|                   | 0 close SSL support             |  |
|                   | 1 open SSL support              |  |
|                   | The default value is 0.         |  |
| <cert></cert>     | Whether to use the certificate. |  |
|                   | 0 Ignore the certificate        |  |
|                   | 1 Use the certificate           |  |

### 13.12 AT+MQTTMIX Set Additional Configuration Parameters

This command is used to set additional configuration parameters.

| Test Command AT+MQTTMIX=?               | Response +MQTTMIX: (0-1) OK         |
|---|-------------------------------------|
| Read Command AT+ MQTTMIX?               | Response +MQTTMIX: <mode> OK</mode> |
| Write Command AT+MQTTMIX= <mode></mode> | Response OK Or ERROR                |

Parameters are defined below:

| Parameters    | Description                                       |
|---------------|---|
| <mode></mode> | 0 No packetid Mode(Default Mode) 1 Packet ID Mode |

### 13.13 URC: Pair indication+MDISCONNECTED:

This URC indicates that the MQTT client is disconnected.

### +MQTT:DISCONNECTED

# **14.FILESYSTEM Commands**

# 14.1 AT+MFSCD Select directory as current directory

The command is used to select a directory.

| Write Command AT+MFSCD= <path></path> | Response +MFSCD: <curr_path> OK or ERROR</curr_path> |
|---------------------------------------|--|
| Read Command AT+MFSCD?                | Response +MFSCD: <curr_path> OK</curr_path>          |
| Test Command AT+MFSCD=?               | Response<br><b>OK</b>                                |

#### Parameters are defined below:

| Parameters              | Description   |
|-------------------------|---|
| <path></path>           | String with double quotes, directory for selection. |
| <curr_path></curr_path> | Current directory without double quotes             |

| AT Commands              | Response                  |
|--------------------------|---------------------------|
| AT+MSFCD="/test1/test 2" | +MFSCD:/test1/test2<br>OK |
| AT+MSFCD=""              | +MFSCD:/test1<br>OK       |

# 14.2 AT+MFSMKDIR Make new directory in current directory

This command is used to create a new directory in current directory.

| Write Command                                   | Response |
|---|----------|
| AT+MFSMKDIR= <dirna< th=""><th>OK</th></dirna<> | OK       |
| me>   | or       |
|   | ERROR    |
| Test Command                                    | Response |
| AT+MFSMKDIR=?                                   | OK       |
|   |          |
|   |          |

#### Parameters are defined below:

| Parameters          | Description  |
|---------------------|--|
| <dirname></dirname> | String with double quotes, directory name which does not already exist in current directory. Maximum name length is 95 name string not sopport non-ascii and cannot contain:  / \: ,* ? "><    Note: dirname length out the range 96, MFSLS can't dispaly dir. |

#### Example:

| AT Commands         | Response                        |
|---------------------|---------------------------------|
| AT+MFSMKDIR="Te st" | OK                              |
| AT+MFSLS=1          | +MFSLS: SUBDIRECTORIES: Test OK |
| AT+MFSMKDIR=?       | ОК                              |

# 14.3 AT+MFSLS List directories/files in current directory

This command is used to list informations of directories and/or files in current directory.

| Execution Command AT+MFSLS            | Response [+MFSLS: SUBDIRECTORIES: <list of="" subdirectories=""> <cr><lf>] [+MFSLS: FILES:<list files="" of=""> <cr><lf>] OK</lf></cr></list></lf></cr></list>   |
|---------------------------------------|--|
| Test Command AT+MFSLS=?               | Response +MFSLS: (list of supported <type>s) OK</type>   |

### 14.5 AT+MFSDEL Delete file in current directory

This command is used to delete a file in current directory. Before do that, it needs to use AT+MFSCD select the father directory as current directory

| Write Command                                       | Response |
|---|----------|
| AT+MFSDEL= <filename< th=""><th>OK</th></filename<> | OK       |
| >   | or       |
|   | ERROR    |
|   |          |
| Test Command  | Response |
| AT+MFSDEL=?   | OK       |
|   |          |

### Parameters are defined below:

| Parameters            | Description  |
|-----------------------|--|
| <filename></filename> | String with double quotes, file name which is relative and already existing. If <filename> is *.*, it means delete all files in current directory.  Maximum name length is 128, name string not sopport non-ascii</filename> |

| AT Commands | Response |
|-------------|----------|
|             |          |

| AT+MFSLS=2                 | +MFSLS: FILES: test_0.txt test_1.txt OK OK |
|----------------------------|--|
| AT+MFSDEL="test_<br>0.txt" | OK   |
| AT+MFSLS=2                 | +MFSLS: FILES:<br>test_1.txt<br>OK         |
| AT+MFSDEL=?                | ОК   |

# 14.6 AT+MFSATTRI Request file attributes

This command is used to request the attributes of file which exists in current directory

| Write Command   | Response                           |
|---|------------------------------------|
| AT+MFSATTRI= <filena< th=""><th>+MFSATTRI: <file_size></file_size></th></filena<> | +MFSATTRI: <file_size></file_size> |
| me>   | ОК                                 |
|   | or                                 |
|   | ERROR                              |
|   |                                    |
| Test Command  | Response                           |
| AT+MFSATTRI=?   | OK                                 |
|   |                                    |
|   |                                    |

### Parameters are defined below:

| Parameters            | Description  |
|-----------------------|--|
| <filename></filename> | String with double quotes, file name which is in currentdirectory. Maximum name length is 128, name string not sopport non-ascii |
| <filesize></filesize> | The size of specified file, and the unit is in Byte.   |

| AT Commands | Response |
|-------------|----------|
|             |          |

| AT+MFSATTRI="im | +MFSATTRI: 8604,2017/04/11 10:24:46 Tue |
|-----------------|---|
| age_0.jpg"      | ОК                                      |
| AT+MFSATTRI=?   | ОК                                      |
|                 |   |

### 14.7 AT+MFSREAD Read File Content

This command is used to create a file in absolute path or current path

| Write Command AT+MFSREAD= <file>,<o< th=""><th>Response +MFSREAD: DATA: <data_size>, <data></data></data_size></th></o<></file> | Response +MFSREAD: DATA: <data_size>, <data></data></data_size> |
|---|---|
| ffs   | ОК  |
| et>, <size></size>  | or<br>ERROR   |
| Test Command AT+MFSREAD=?   | Response<br>OK  |

### Parameters are defined below:

| Parameters        | Description  |
|-------------------|--|
| <file></file>     | String with double quotes, fileshould already exist,.Maximum file name length is 128 |
| <offset></offset> | offset from the file beginning, <offset> should less than file size.</offset>        |
| <size></size>     | 0-1024 Size of data to be read, Reads the entire file when set to 0.                 |

| AT Commands                 | Response                             |
|-----------------------------|--------------------------------------|
| AT+MFSREAD="Te stfile",0,10 | +MFSREAD: DATA: 10, 1234567890<br>OK |
| AT+MFSREAD=?                | ОК                                   |

### 14.8 AT+MFSCREATE Create a new File

This command is used to create a file in absolute path or current path

| Write Command               | Response |
|-----------------------------|----------|
| AT+MFSCREATE= <file></file> | OK       |
|                             | or       |
|                             | ERROR    |
| Test Command                | Response |
| AT+MFSCREATE=?              | ОК       |
|                             |          |
|                             |          |

# Parameters are defined below:

| Parameters    | Description  |
|---------------|--|
| <file></file> | ing with double quotes, file name which does not already exist in directory. Max file name string length is 95 and max whole path length is 1024 name string not sopport non-ascii and cannot contain:  /\:, * ? ">< |

### Example:

| AT Commands      | Response       |
|------------------|----------------|
| AT+MFSCREATE="   | OK             |
|                  |                |
| Testfile"        |                |
| AT MEOLO-0       | INFOLO. FILFO. |
| AT+MFSLS=2       | +MFSLS: FILES: |
|                  | Testfile       |
|                  | OK             |
|                  |                |
|                  | OK             |
| AT+MFSCREATE=?   | OK             |
| AITWIF SCREATE-! | ON             |
|                  |                |

### 14.9 AT+MFSMEM Check the size of available memory

This command is used to check the size of total memory and available memory

| Action Command | Response   |
|----------------|--|
| AT+MFSMEM      | +MFSMEM: C:( <total>, <available>)</available></total> |
|                | OK   |
|                | or   |
|                | ERROR  |
|                |  |
| Test Command   | Response   |
| AT+MFSMEM=?    | OK   |
|                |  |
|                |  |

| Parameters              | Description                                |
|-------------------------|--|
| <total></total>         | The total size of local storage space.     |
| <available></available> | The available size of local storage space. |

### Example:

| AT Commands | Response                           |
|-------------|------------------------------------|
| AT+MFSMEM   | +MFSMEM: C:(1348480, 221600)<br>OK |
| AT+MFSMEM=? | OK                                 |

# 14.10 AT+MFSRENAME Rename file or subdirectory in current

# directory

This command is used to rename a file or subdirectory in current directory.

| Write Command                                | Response |
|--|----------|
| AT+MFSRENAME= <old< th=""><th>ОК</th></old<> | ОК       |
| _name>, <new_name></new_name>                | or       |
|  | ERROR    |
|  |          |

| AT+MFSRENAME=? OK |  |
|-------------------|--|
|                   |  |
|                   |  |

| Parameters            | Description   |
|-----------------------|---|
| <old_name></old_name> | String with double quotes, name which is existed in current directory.  |
| <new_name></new_name> | New name of specified file, string with double quotes.  Maximum name string length is 95.  Name string not support non-ascii and cannot contain:  / \ : , * ? ">< |

#### Example:

| AT Commands              | Response |
|--------------------------|----------|
| AT+MFSRENAME="ima        | OK       |
| ge_0.jpg","image_1.jpg " |          |
| AT+MFSRENAME=?           | ОК       |

# 14.11 AT+MFSCOPY Copy an appointed file

This command is used to copy an appointed file on / to an appointed directory on /, the new file name should give in parameter.

| Test Command | Response |
|--------------|----------|
| AT+MFSCOPY=? | OK       |
|              |          |
|              |          |
|              |          |

### Write Command Response AT+MFSCOPY=<file1>,< file2>[,<sync\_mode>] synchronous mode(sync\_mode = 0): +MFSCOPY:<percent> [+MFSCOPY:<percent>] OK or **BUSY** or +MFSCOPY:FAIL **ERROR** asynchronous mode(sync\_mode = 1): OK +MFSCOPY:<percent> +MFSCOPY:[<percent>] +MFSCOPY:100.0 BUSY or OK +MFSCOPY:FAIL Reference Note 1.The<file1> and <file2> should give the whole path and name, if only given file name, it will refer to current path(AT+MFSCD) and check the file's validity. 2. If <file2> is a whole path and name, make sure the directory exists, make sure that the file name does not exist or the file name is not the same name as the sub folder name, otherwise return error. 3. <percent> report refer to the copy file size. The big file maybe report many times, and little file report less. 4. If <sync\_mode> is 1, the command will return OK immediately, and report final result with +MFSCOPY: END. If not set<sync mode>, use the default value. Multiple asynchronous copy operations are not supported at the same time, the busy state is returned

| arameters | Description |
